DEVELOPMENT  
**ATLAS**  
2012

# FOREWORD

I congratulate the Central Statistical Office and the United Nations Development Programme for their collaborative effort to produce this Trinidad and Tobago Human Development Atlas. This Atlas marks the first time that Human Development Indicators, Millennium Development Goals data, Crime and Violence statistics and data covering Trinidad and Tobago by regions are represented in such a format. The data will assist us to establish the status of the country and our people as of 2010 and provides a baseline for improving the condition of the people of Trinidad and Tobago.

By documenting the state of human development using spatial representations, the Atlas allows us to view specific aspects of human development, including the MDGs and crime and violence, in Trinidad and Tobago at a regional level. We are able to identify clearly the regions where poverty is highest or lowest, or where crime is more of a problem, or is perceived to be. Discrepancies among the various regions permit policymakers to ask questions about how resources are allocated to tackle national issues. More and better information can support better decisions with a more targeted focus.

Beyond regional disparities, gender disparities and the satisfaction of basic human needs become an issue. The Gender Inequality Index measures gender-based disadvantages and have implications for policy initiatives aimed at improving gender imbalances. The Multi-Dimensional Poverty Index gives us a different approach to measuring poverty, extending the measurement to assess health, education and standards of living, fundamental aspects of human well being.

The Atlas and the information presented therein carry significance for policy formulation, planning and evidence-based decision making. In developing strategy for regional and even the sub regional level, the Atlas gives us pictures of where inequalities in regional development have been most prevalent. This can guide us as policymakers in developing and implementing policy beyond the national level.

National policy over the medium term is expressed in the Government's Medium Term Policy Framework 2011-2014, which outlines Government strategic plans for national development. The Medium Term Policy Framework is guided by the seven pillars which informs policy:

- Pillar 1: People-Centred Development
- Pillar 2: Poverty Eradication and Social Justice
- Pillar 3: National and Personal Security
- Pillar 4: Information and Communication Technologies
- Pillar 5: A More Diversified, Knowledge Intensive Economy
- Pillar 6: Good Governance
- Pillar 7: Foreign Policy

Additionally five priority areas are identified for particular attention over the period covered, these are:

1. Crime and Law and Order;
2. Agriculture and Food Security;
3. Health Care Services and Hospitals;
4. Economic Growth, Job Creation, Competitiveness and Innovation; and
5. Poverty Reduction and Human Capital Development.

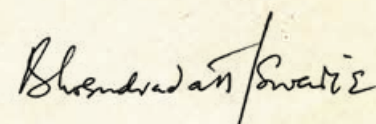

These five priority areas are reflected in the Atlas at various levels, from the maps on Crime and Violence in Section 3 which are relevant to the first priority area – Crime and Law and Order, to the maps on the population having Chronic Illnesses and the Intensity of Multi Dimensional Poverty for the Health Dimension, which relate to the third priority area – Health Care and Hospitals. In reviewing the Medium Term Policy Framework to produce new iterations in the future, taking into account the information presented in the Atlas, along with other data and statistics, will be critical to formulating and revising policy measures and actions and targeting them better.

The reader will discern that there are in fact wide disparities among the various regions in Trinidad and Tobago in terms of human development and achievement. There are differences in human

development between urban and rural areas, where city centres show higher indicators in most cases. Urban areas also tend to have more access to electricity and clean water, with access to improved sanitation being more of a mixed bag. Conversely, the rural areas have much lower crime rates and residents there report fewer instances of victimisation. These differences where identified, can be used to tailor policies and resource allocation more effectively to alleviate social and economic ills and to develop the physical infrastructure to the sub regional and local levels.

One of the major challenges for us as policymakers is to find the balance among these and other competing issues, each calling for public action to effect remedy and change.

However it is very important to establish the facts and to have accurate data. This Atlas presents us with the opportunity to move from where we found the country in year 2010. It facilitates assessment of progress, if any between 2010 and the current time, it allows us to determine what are the best ways to target specific measures in specific locations and finally it gives us a genuine opportunity to measure progress on an ongoing basis so that necessary interventions can be made at the appropriate time and place in the most strategic way.

**Dr. Bhoendradatt Tewarie**  
**Minister of Planning and Sustainable Development**

# PREFACE BY THE UNDP

Trinidad and Tobago has experienced considerable economic growth from 1995 to 2008 and it has one of the highest per capita incomes in Latin America and the Caribbean. However these important aggregate economic indicators have not spared the country and its citizens from experiencing growing levels of poverty and inequality observed in income, education, life expectancy and other important social and economic indicators. The visible slowdown in the international economy that started in 2008 has also negatively affected the country's main markets and contributed to a decrease in the number and quality of available jobs and opportunities for many.

Building on the human development approach, this first Human Development Atlas seeks to map patterns of development throughout Trinidad and Tobago and identify where growing discrepancies between wealth and poverty exist. Access to national social statistics and data made possible the calculation of composite indicators including the first national human development index, the Inequality-adjusted National Human Development Index, the Gender Inequality Index and the Multidimensional Poverty Index for Trinidad and Tobago. The atlas brings together 60 plus different maps, tables, visualization trends on a wide range of social and economic issues, including crime and violence and the gender dimensions of inequality. Another important feature of this unique publication is the presentation of the different sets of data disaggregated by the 15 administrative units.

The Atlas has been prepared by a team of contributors from the Central Statistical Office and from the United Nations Development Programme office in Trinidad and Tobago, to whom I express my

gratitude. The Atlas team also included a number of representatives from other agencies and organizations, whose cooperation and dedication is much appreciated.

The end result of this endeavor is a beautifully illustrated and highly informative resource and publication intended not only for the specialized reader but also for the general public, aiming to 'bridge the gap' between public perceptions, policymaking and public knowledge.

We sincerely hope the Atlas will be disseminated widely and will educate and inspire citizens and policy makers to want to know more about these critical issues and to adopt a more inclusive and participatory approach to address the present levels of inequality of access and opportunities for all Trinidadians and Tobagonians.

**Dr. Marcia de Castro**

**UN Resident Coordinator / UNDP Resident Representative**

**United Nations, Trinidad and Tobago**

# PREFACE BY THE CENTRAL STATISTICAL OFFICE

The Central Statistical Office (CSO) is pleased to have collaborated with the United Nations Development Programme (UNDP) in the production of the Trinidad and Tobago Human Development Atlas 2012. The publication of the Atlas represents another effort by CSO to present statistical information in a user-friendly, non-technical format. This initiative enhances the readers' ability to understand and interpret statistical information thus promoting statistics literacy in the population. The Trinidad and Tobago Atlas is a follow up from an earlier collaboration between the CSO and the UNDP, which resulted in the development of 'T&T Today'- a graphic presentation of time series data which was published on our respective web sites.

The Human Development Atlas 2012, the first of its kind in the CARICOM region is an important addition to the information arsenal available to development researchers and public sector technocrats interested in empirical information for decision-making. It is hoped that the use of the Atlas will lead to tangible sustainable development initiatives that will benefit the citizenry. The project though very demanding at the onset, developed into a genuinely rewarding exercise and a tremendous learning and capacity building opportunity. More importantly however, it has emphasised the need for a more deliberate approach in the design of survey instruments that allow for the gathering and output of regionally disaggregated information, alongside the usual country-level statistical analyses.

The spatial analysis of regionally disaggregated human development indicators provided new insights on social progress and human development across the country. This has stimulated research interest for a better understanding of the social and economic conditions influencing the uneven distribution of wealth among local communities.

The comparative analysis across regions within Trinidad and Tobago will bring into focus areas of underdevelopment and lagging development. This analysis can then inform evidence-based public policy. Thus, leading to greater equity in the allocation of public resources; creating the opportunity to transform communities, improve the quality of life of the citizenry and offer the people of Trinidad and Tobago the opportunity to develop to their fullest potential.

The CSO and the UNDP, in demonstration of support for the Open-Data Movement have agreed to provide public access to information contained in the Atlas via our respective web sites. The public is encouraged to make use of the publication which contains a wealth of information about the environment in which they live. We look forward to receiving feedback for the improvement of future releases of this product.

I wish to express my deepest appreciation and thanks to Dr. Marcia De Castro United Nations Resident Coordinator / UNDP Resident Representative in Trinidad and Tobago and her very energetic staff, in particular Mr. Gianluca Giuman, the former MDG Analyst, Ms. Isele Robinson-Cooper and Ms. Lebrechtta Nana Oye Hesse-Bayne for their support provided to the CSO throughout all the phases of this project and for the exemplary model of inter-agency cooperation. I also wish to thank the UNDP for locating and making available to the CSO the services of Mr. Akbar Abdurakhmanov as the Statistician consultant to the project. Akbar's experience and expertise brought this project to fruition within a limited time frame and his willingness to discuss and document the methodology has provided genuine knowledge transfer and capacity building.

Special thanks are extended to the Office of Disaster Preparedness and Management (ODPM) whose Map contributions on hazard and disaster have enriched the quality of the Human Development Atlas in its usefulness and outreach.

Sincere appreciation is extended to two of CSO's recent young professional recruits- Mr. Stephan Samuell, whose enthusiasm and diligence ensured that all data requirements were met on a timely basis and Mr. Gary Williams whose skill in graphic design enhanced the maps and produced the cover of the Atlas. Special thanks must also be extended to Mr. Roger Jugmohan, CSO's Human Development Map Project Team Leader, Mr. Sterling Chadee, Senior Statistician Economic Statistics, Ms. Nalini Bahadoorsingh, Mr. Carmichael Ellis and the staff of the GIS section. The successful planning and coordination provided by Ms. Julianne Jones and Ms. Lisa Granger is sincerely acknowledged. The completion of the Atlas could not have been possible without contributions made by other staff members of the CSO who supported the project at various stages of its implementation.

I am deeply indebted to my colleagues of the Socio Economic Policy Planning Division, the National Transformation Unit and the Town and Country Planning Division of our parent Ministry of Planning and Sustainable Development, led by Deputy Permanent Secretary Sheryl Anne Haynes. The invaluable contribution of Ms. Ayleen Ovid, Joanne Deoraj, Erica Fortune, Melissa Bertrand, Subrina Nanan, Fayola Merrique, Camille Spencer and Kerry Ann Gilbert, who worked efficiently to review and edit the Atlas and contributed the Analysis and Map Highlights is truly appreciated.

**Dave Clement**  
**Director of Statistics**  
**Central Statistical Office**  
**Ministry of Planning and Sustainable Development**

# ACKNOWLEDGEMENTS

The preparation of the 2012 Human Development Atlas of Trinidad and Tobago has been an enormous collaborative effort. This publication, a joint effort between the Central Statistical Office (CSO) and the United Nations Development Programme (UNDP) in Trinidad and Tobago; could not have been developed without the vision and intellectual leadership of Mr. Dave Clement, Director of Statistics of the CSO and Dr Marcia de Castro, UN Resident Coordinator and UNDP Resident Representative for Trinidad and Tobago and their respective teams.

We wish to extend our appreciation to the Minister of Local Government, Dr the Honourable Surujrattan Rambachan and to the Minister of Planning and Sustainable Development, Senator Dr the Honourable Bhoendradatt Tewarie and members of his team who asked UNDP to partner with the Central Statistical Office to produce information on the current situation of human development in the country and for giving UNDP access to a rich set of national statistics and data that have been utilized in the preparation of the maps.

Special thanks go to Mr. Akbar Abdurakhmanov; Statistician with the Uzbekistan Academy of Sciences who provided the technical expertise on statistics, data analysis and mapping and worked with the CSO team to select, prepare and organize the data sets to calculate the different human development indices for Trinidad and Tobago. Mr. Abdurakhmanov also prepared most of the maps and the statistical tables on key aspects of human development and on crime and citizen security survey data included in the publication.

The statistics used to produce the maps come from different official Government sources. Special thanks goes out to the Trinidad and Tobago Central Statistical Office, the Crime and Problem Analysis Unit in the Ministry of National Security (Crime and Violence data), and the United Nations Development Programme Bureau for Latin America and the Caribbean (Citizen Security Survey data) for making available the data used in the many different maps included herein. We would like to thank the very capable team at the Central

Statistical Office led by Mr. Dave Clement, Director of Statistics, Mr. Roger Jugmohan, Mr. Stephan Samuell, Mr. Gary Williams, Mr. Sterling Chadee, Mr. Andre Blanchard and Ms. Mohanie Mitchell for their excellent work and support.

Most crime statistics used in the Atlas came from the Ministry of National Security, Crime and Problem Analysis Unit. Our thanks go to Police Commissioner Dwayne Gibbs, Acting Sergeant Neal R. Rawlins – Lead Analyst, Western and Tobago Divisions; Constable Richard Prince; Constable Gerald Moore and Sergeant Kazim Ali for their valuable contribution to this project.

The Hazard and Disaster related Maps brought out the environmental dimension of human development. We are most grateful to Dr. Stephen Ramroop, CEO of ODPM, Ms. Shelly Bradshaw, Ms. Candice Ramkissoon, the ODPM GIS team and all other staff of the ODPM for their significant contribution.

A number of UNDP staff worked in the development of the Atlas and provided different levels of support and technical expertise to help complete the publication. Mr. Gianluca Giuman worked closely with the lead Statistician and with the CSO to prepare the maps and provided overall guidance to the project. We would also like to acknowledge the contributions made by Ms. Alana Wheeler, Mrs. Lebrechtta Nana Oye Hesse-Bayne, Ms. Isele Robinson-Cooper and Ms. Rose Aquing-Gomes for their assistance in the compilation of the information, editing, and analysis of the data. A special thanks goes to Ms. Maria Blanco Lora who designed and produced the beautiful display banners to promote the Atlas.

The talent and commitment of each member of these diverse groups helped to move the project forward efficiently and effectively. The UNDP and CSO teams would like to thank everyone who took part, directly and indirectly, in the production of the Atlas and accept full responsibility for any errors and omissions.

# OVERVIEW

The Trinidad and Tobago Human Development Atlas is a joint effort of the UNDP in Trinidad and Tobago and the Central Statistical Office to map human development in Trinidad and Tobago today.

The collection of maps, the first of its kind for Trinidad and Tobago, provides an in-depth and spatially disaggregated analysis of development trends across regions within Trinidad and Tobago.

Building on the concept of human development (see box 1.0), the present Atlas includes the calculation of a number of composite indicators including the first National Human Development Index, the Inequality-adjusted National Human Development Index, the Gender Inequality Index and the Multidimensional Poverty Index for Trinidad and Tobago.

The data used in the Atlas comes from official national surveys and statistics covering the period 2006 to 2010. Most of the national data are collected and managed by the Central Statistical Office.

**The Atlas is organised into five broad categories:**

## Human Development Maps

These maps provide an overview of key aspects of human development at the country level and disaggregated by the 15 regional corporations. Tables summarizing the composite indicators and data points used for the maps can be found in the annexes.

## Millennium Development Goals – MDG maps

These maps have been produced by analysing data collected by the Household Budget Survey, 2008-2009; the 2010 Population, Social and Vital Statistics and the Multiple Indicator Cluster Survey (MICS 3)

of 2006. These maps illustrate levels of attainment of MDGs including poverty, basic health, sanitation, nutrition, education etc.

## Crime and Violence Maps

Maps under this cluster have been produced with crime statistics data provided by the Ministry of National Security and data from the Citizen Security Survey commissioned by UNDP as part of the UNDP Caribbean Human Development Report 2012.

## Hazard and Disaster Related Maps

The maps in this category prepared by the Office of Disaster Preparedness and Management (ODPM) under the Ministry of National Security identify disaster-prone areas in Trinidad and Tobago relating to rivers and floods, earthquakes and hazard-prone areas.

### Box 1.0

Human development is a process of enhancing human capabilities while protecting the rights and freedoms; expanding choices and opportunities so that each person can lead a life of respect and value. The concept of human development puts people at the centre of development, regards economic growth as a means and not an end, and addresses intragenerational and intergenerational equity, enabling present and future generations to make the best use of their capabilities and to realize their potential.

## Municipal Indicator Profiles

This section brings together a common set of indicators creating a human development profile for each municipal area. This allows the reader to easily compare human development across regions.

The depth of information contained in the Atlas makes it possible to examine broad development trends in the country, as well as map possible strategies to ensure further progress towards human development.

- The Central Statistical Office (CSO) is a repository of a significant number of high quality and comprehensive national datasets. The production of the Atlas created the opportunity; for the first time, to present statistical data in a user-friendly manner by municipal regions. Datasets were previously reported mainly in statistical tables at the country level. The availability of aggregated and disaggregated datasets on human development can and should encourage greater use of the data.
- By presenting the statistics in geographical format at the municipal level, the atlas allows the user to have an overview of spatial inequalities and patterns of development in Trinidad and Tobago.

## How to use the maps and tables

The Human Development Atlas is a tool that can be used in many different ways and by many different groups.

The information contained in the Atlas is of great value to government officials working at the local, regional and national levels. Senior government officials in charge of setting national priorities can use the information highlighted in the maps to inform decision making and to allocate public funds efficiently. Public administrators and

policymakers in charge of planning, design and or implementation of public programmes can incorporate social-economic and spatial data into existing programmes and ensure that new ones will include robust evidence based content.

Researchers in academia and students will have access to hard to find disaggregated socio-economic information and be able to gain a better understanding of existing levels of social and spatial inequalities, use the information in their own research and expand the present work into new fields of analysis and enquiry.

The media will find in the Atlas readily available geographical and statistical data on important indicators like the human development index and its components (life expectancy, education attainment and per capita income), on various dimensions of the Millennium Development Goals and on patterns of crime and victimization to produce objective and informative stories about the most pressing issues affecting different communities, regions and /or the country today .

Civil society organizations and community based groups can use the information presented in the Atlas and tables to engage in a dialogue with citizens on what is happening in their communities, what information is available on their region and towns and how to use the data in the preparation of community based strategies and plans.

# LIST OF MAPS

## AND MUNICIPAL INDICATOR PROFILES INCLUDED IN THE ATLAS

### Part 1. Human Development Maps

#### 1.1 National Human Development Index

1.	National Human Development Index (2008-2009) by Administrative Areas	4
2.	National Human Development Index and Dimension Indices (2008-2009) by Administrative Areas	5
3.	Percentage of Population having Chronic Illnesses (2008-2009) by Administrative Areas	6
4.	Primary and Secondary Educational Attainment Rate (2008-2009) by Administrative Areas	7
5.	Secondary and Higher Educational Attainment Rate (2008-2009) by Administrative Areas	8
6.	Household Income Per Capita Per Year (2008-2009) by Administrative Areas	9

#### 1.2 Inequality Adjusted National Human Development Index

7.	Inequality Adjusted National Human Development Index (2008-2009) by Administrative Areas	14
8.	Inequality Adjusted National Human Development Index and Loss due to Inequalities (2008-2009) by Administrative Areas	15
9.	Loss in Human Development in Long and Healthy Life Dimension (2008-2009) due to Inequalities in Chronic Illness Indicator by Administrative Areas	16
10.	Loss in Human Development in Knowledge Dimension (2008-2009) due to Inequalities in Primary and Secondary Educational Attainment Rate by Administrative Areas	17
11.	Loss in Human Development in Knowledge Dimension (2008-2009) due to Inequalities in Secondary and Higher Educational Attainment Rate by Administrative Areas	18
12.	Loss in Human Development in Standard of Living Dimension (2008-2009) due to Inequalities in Household Income Per capita Per year by Administrative Areas	19

#### 1.3 Gender Inequality Index

13.	Gender Inequality Index (2010) by Administrative Areas	24
14.	Adolescent Fertility Rate (2010) by Administrative Areas	25
15.	Gender Inequality Index and Labour Force Participation Rate (2010) by Administrative Areas	26
16.	Gender Inequality Index and Percentage of Population with at least Secondary Education (2010) by Administrative Areas	27

#### 1.4. Multidimensional Poverty Index

17.	Multidimensional Poverty Index (2006) by Administrative Area	32
18.	Intensity of Multidimensional Poverty (2006) by Administrative Areas	33
19.	Multidimensional Poverty (2006) by Administrative Areas	34
20.	Intensity of Multidimensional Poverty and its Dimensions (2006) by Administrative Areas	35

21.	Intensity of Multidimensional Poverty for Health Dimension (2006) by Administrative Areas	36
22.	Intensity of Multidimensional Poverty for Education Dimension (2006) by Administrative Areas	37
23.	Intensity of Multidimensional Poverty for Standard of Living Dimension (2006) by Administrative Area	38

## Part 2. MDG Maps

24.	Total Population (2010) by Administrative Areas	44
25.	Life Expectancy at Birth (2010) by Administrative Areas	45
26.	Percentage of Households in which a child died (2006) by Administrative Areas	46
27.	Population without Electricity (2006) by Administrative Areas	47
28.	Population without Access to Clean Drinking Water (2006) by Administrative Areas	48
29.	Population without Access to Improved Sanitation Facilities (2006) by Administrative Areas	49
30.	Population not Consuming Iodized Salt (2006) by Administrative Areas	50
31.	Primary and Secondary Educational Attainment Rate (2008-2009) by Administrative Areas	51

## Part 31. Crime and Violence Maps

32.	The Most Serious Problems in the Country by Police Divisions	58
33.	Comparative Map showing Actual Victimization within the last Ten Years and Within the last Year by Police Divisions	59
34.	Comparative Map showing Actual Victimization within the last Ten Years and Frequency of Victimization by Police Divisions	60
35.	Actual Victimization in 2009 by Police Divisions	61
36.	Comparative Map showing Actual Victimization within the last Ten Years and Household Victims within last year by Police Divisions	62
37.	Comparative Map showing Actual Victimization in 2009 and Reported Incidents by Police Divisions	63
38.	Actual Victims of Sexual Assault in 2009 by Police Divisions	64
39.	Frequency of Domestic Violence in Households by Police Divisions	65
40.	Frequency of Verbal Threats by Police Divisions	66
41.	Frequency of Physical Injury from partner in Households by Police Divisions	67
42.	Frequency of Verbal Abuse from partner by Police Divisions	68
43.	Frequency of Physical Abuse from partner by Police Divisions	69
44.	Is Crime a Problem in Your Community?	70
45.	Comparative Map showing Extent of Crime and Frequency of Violent Crimes in the Community by Police Divisions	71
46.	Existence of Criminal Gangs by Police Divisions	72
47.	Comparative Map showing Existence of Criminal Gangs and Extent of Gang Violence by Police Divisions	73
48.	Fear of Crime in Past Year by Police Divisions	74
49.	Comparative Maps showing Fear of Crime in Past Year and Feelings of Insecurity by Police Divisions	75
50.	Comparative Maps showing Fear of Crime in Past Year and Perception of Country's Capabilities by Police Divisions	76
51.	Perception of Change in Police Effectiveness at National Level by Police Divisions	77
52.	Perception of Change in Police Effectiveness at Community Level by Police Divisions	78
53.	Public Confidence in Police Response to Emergency Calls by Police Divisions	79

54.	Public Confidence in Police to Control Crime by Police Divisions	80
55.	Serious Crimes (2010) by Police Divisions	82
56.	Share of Serious Crimes (2010) by the Type of Crime by Police Divisions	83
57.	Serious Crimes: Burglaries and Breakings (2010) by Police Divisions	84
58.	Serious Crimes: General Larceny (2010) by Police Divisions	85
59.	Serious Crimes: Robberies (2010) by Police Divisions	86
60.	Serious Crimes: Larceny of Motor Vehicles (2010) by Police Divisions	87
61.	Serious Crimes: Larceny of Dwelling House (2010) by Police Divisions	88
62.	Serious Crimes: Murder (2010) by Police Divisions	89
63.	Serious Crimes: Woundings and Shootings (2010) by Police Divisions	90
64.	Serious Crimes: Rapes, Incest and Sexual Offences (2010) by Police Divisions	91
65.	Serious Crimes: Serious Indecency (2010) by Police Divisions	92
66.	Serious Crimes: Kidnapping (2010) by Police Divisions	93
67.	Serious Crimes: Fraud Offences (2010) by Police Divisions	94
68.	Serious Crimes: Narcotic Offences (2010) by Police Divisions	95

#### Part 4. Municipal Indicator Profiles

69.	Arima	98
70.	Chaguanas	99
71.	Couva/Tabaquite/Talparo	100
72.	Diego Martin	101
73.	Mayaro/Rio Claro	102
74.	Penal/Debe	103
75.	Point Fortin	104
76.	Port of Spain	105
77.	Princes Town	106
78.	San Fernando	107
79.	San Juan/Laventille	108
80.	Sangre Grande	109
81.	Siparia	110
82.	Tobago	111
83.	Tunapuna/Piarco	112

#### Part 5. Hazard and Disaster Related Maps

84.	Flood Impacted Communities (1999-2011)	118
85.	Hazard Impact (2006-2011) by Administrative Areas	119
86.	Landslide Susceptibility	120
87.	Flood Susceptibility	121

# PART 1: HUMAN DEVELOPMENT

Giving people the choice to enjoy a long and healthy life; being educated; having access to resources that enable one to live in dignity; and being able to participate in decisions that affect one's community are core capacities for human development. The series of maps included in this first section provide an overview of key aspects of human development at the country level. The maps include composite indices estimated by the Central Statistical Office and UNDP using the methods developed by UNDP to calculate human development indicators. The maps depict different dimensions of human development including, a long and healthy life, knowledge and a decent standard of living. All maps in this segment were produced with data collated by the Central Statistical Office.

## 1.1 NATIONAL HUMAN DEVELOPMENT INDEX (NHDI)

*Source data: Household Budget Survey 2008-2009*

The Human Development Index (HDI) is a summary measure of human development. It measures the average achievements in a country in three basic dimensions of human development: a long and healthy life, knowledge, and a decent standard of living. The National Human Development Index (NHDI) was developed by the CSO to measure the level of human development of Trinidad and Tobago and its sub-regions. The NHDI was constructed using country-specific indicators reflecting human development in the aforementioned three basic dimensions. The NHDI and its dimension indicators were disaggregated at the sub-regional level to compare levels and disparities among different sub-populations within Trinidad and Tobago. The highlighting of internal disparities using HDI methodology has prompted constructive policy debates in many countries. For the NHDI, the long and healthy life dimension is measured by the percentage of the population suffering from chronic illness. The knowledge dimension is measured by two indicators: primary and secondary educational attainment rate (% ages 6-16) and secondary and higher educational attainment rate(% ages 17 and above). The decent standard of living dimension is measured using household income per capita per year.

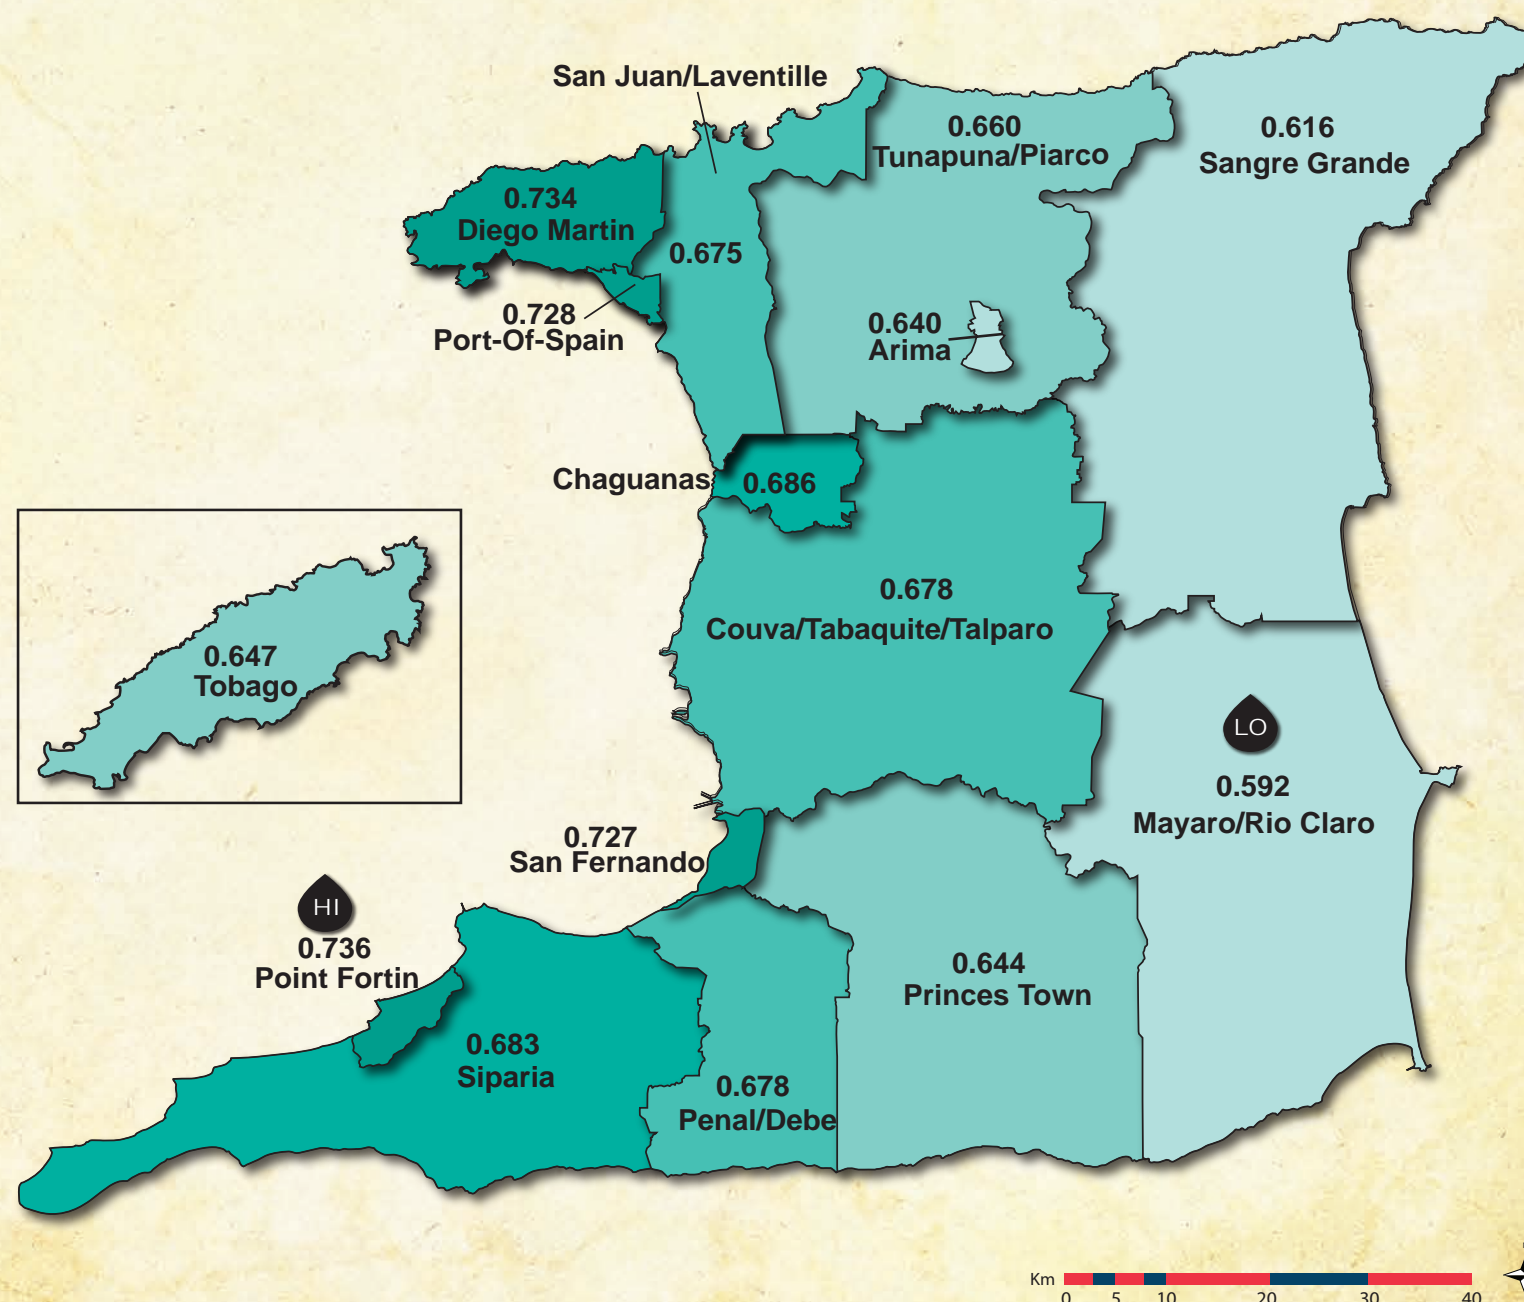

## Summary of Atlas Results

- Out of the four indicators relating to the National Human Development Index, Point Fortin ranked the highest in primary and secondary educational attainment rate and had the lowest percentage of the population with chronic illness.
- Mayaro/Rio Claro ranked the lowest in the National Human Development Index and had the lowest performance in primary and secondary educational attainment rate.
- Tobago had the lowest as in household income per capita per year, whilst San Fernando ranked the highest. San Fernando also ranked the highest in Secondary and Higher Educational Attainment Rate compared to Sangre Grande which scored the lowest.
- Overall Sangre Grande and Mayaro/Rio Claro had the lowest NHDl figures in the four areas of measurement.

## Household Income Per Capita Per Year (2008-2009) by Administrative Areas

Source: Central Statistical Office, Household Budget Survey 2008-2009

Household income per capita per year is the annual mean income earned by all members of all households. It is calculated using the total income of all members of all households divided by the number of household members.

Household income per capita per year was calculated using the Household Budget Survey (2008-2009). To express the household income per capita per year in US\$, a 2005 Purchasing Power Parity (PPP) conversion rate was used.

Household income per capita per year

## What does the NHDI tell us?

The HDI, likewise the Trinidad and Tobago NHDI is constructed to emphasize that people and their capabilities should be the ultimate criteria for assessing the development of a country, not economic growth alone.

## Can the NHDI alone measure a country's level of development?

No. The concept of human development is much broader than what can be captured in the NHDI, or any other of the composite indices (Inequality-adjusted NHDI, Gender Inequality Index and Multidimensional Poverty Index). The NHDI, for example, does not reflect political participation or gender inequalities. The NHDI and the other composite indices can only offer a broad proxy on some of the key issues of human development, gender disparity and human poverty. A fuller picture of a country's level of human development requires analysis of other indicators.

## Why does the NHDI not include dimensions of participation, gender and equality?

As a simple summary index, the NHDI is designed to reflect average achievements in three basic aspects of human development – leading a long and healthy life, being knowledgeable and enjoying a decent standard of living. The policy of the Human Development Report Office has always been to construct additional complementary composite indices for covering some of the “missing” dimensions in the HDI, which the

NHDI mirrors. Gender disparity, inequality and human deprivation are measured by other indices (Gender Inequality Index, Multidimensional Poverty Index and Inequality-adjusted NHDI). Participation and other aspects of well-being are measured using a range of objective and subjective indicators and are discussed in the Report. Measurement issues related to these aspects of human development demonstrate the conceptual and methodological challenges that need to be further addressed.

### Can the Household Income per capita per year be used to measure human development instead of the NHDI?

No. Household Income per capita per year only reflects annual average national income. It tells nothing of how that income is spent, whether on universal health, education or military expenditure.

## 1.2 INEQUALITY ADJUSTED NATIONAL HUMAN DEVELOPMENT INDEX (INHDI)

*Source data: Household Budget Survey 2008-2009*

The Inequality-adjusted National Human Development Index (INHDI) adjusts the National Human Development Index (NHDl) for inequality in distribution of each dimension across the population. The INHDI accounts for inequalities in NHDl dimensions by “discounting” each dimension’s average value according to its level of inequality. The INHDI equals the NHDl when there is no inequality across people but is less than the NHDl as inequality rises. In this sense, the INHDI is the actual level of human development (accounting for this inequality), while the NHDl can be viewed as an index of “potential” human development (or the maximum level of NHDl) that could be achieved if there was no inequality. The “loss” in potential human development due to inequality is given by the difference between the NHDl and the INHDI and can be expressed as a percentage. The NHDl represents a national average of human development achievements in the three basic dimensions making up the NHDl: health, education and income. Like all averages, it conceals disparities in human development across the population within the same country. The INHDI takes into account not only the average achievements of a country on health, education and income, but also how those achievements are distributed among its citizens.

# Summary of Atlas Results

## ***Health, Education and Income:***

- In reviewing the dimensions of health, education and income for the Inequality Adjusted National Human Development Index, the Mayaro/Rio Claro, Tobago and Sangre Grande regions ranked lowest.

## ***Loss in Human Development due to inequality in Health, Education and Income:***

- Tobago, Point Fortin and Tunapuna/Piarco had the greatest total percentage losses in Human Development. (HBS 2008-2009). San Fernando had the lowest value in Human Development within the same period.

## ***Chronic Illnesses:***

- Penal/Debe, Mayaro/Rio Claro, Couva/Tabaquite/Talparo and Tunapuna/Piarco regions were least affected by inequality (0.5% or less in Human Development Loss), in terms of the long and healthy life dimension due to chronic illness. Tobago, Port of Spain, Sangre Grande and San Juan / Laventille had a higher score of loss (greater than 2%) and were therefore the most impacted by inequality.

## ***Primary and Secondary Educational Attainment Rate:***

- In the Diego Martin, Port of Spain, Chaguanas, Couva/Tabaquite/Talparo, Tobago, Point Fortin and Siparia regions, Human Development loss in 2008-2009 was less than 0.1%. The Mayaro/Rio Claro, Arima and Sangre Grande regions had a ranking greater than 1.5% Human Development loss over that same period.

## ***Secondary and Higher Education Attainment Rate:***

- Port of Spain, San Fernando, Arima, Tunapuna/Piarco and Diego Martin had less percentage loss in Human development due to inequalities in Secondary and Higher Educational Attainment. Point Fortin, Siparia and Princes Town had the highest percentage ranking which meant that the loss in human development due to inequalities in Secondary and Higher Educational Attainment was greater.

## ***Household Income:***

- Siparia had the lowest percentage in household income per capita per year (17.7% ). Tobago and Tunapuna/Piarco had the highest percentage rankings of 33.5 and 30.9 respectively.

## How should the INHDI be interpreted?

While the NHDl can be viewed as an index of “potential” human development that could be obtained if achievements were distributed equally, The INHDI is the actual level of human development (accounting for inequality in the distribution of achievements across people in a society). The INHDI will be equal to the NHDl when there is no inequality in the distribution of achievement across people in society, but falls below the NHDl as inequality rises. The loss in potential human development due to inequality is the difference between the NHDl and INHDI, expressed as a percentage.

## What is the policy relevance of the INHDI?

The INHDI allows a direct link to inequalities in dimensions of the NHDl to the resulting loss in human development, and thus it can help inform policies towards inequality reduction and to evaluate the impact of various policy options aimed at inequality reduction.

## What are the limitations of the INHDI?

The INHDI captures the inequality in distribution of the NHDl dimensions. However, it is not association sensitive, meaning it does not account for overlapping inequalities—whether the same people experience the multiple deprivations. Also, the individual values of indicators such as income can be zero or even negative, so they have been adjusted to non-negative non-zero values uniformly across regions.

## 1.3 GENDER INEQUALITY INDEX

*(Source Data – CSO Population Social & Vital Statistics 2010)*

The Gender Inequality Index (GII) reflects gender-based disadvantage in three dimensions – reproductive health, empowerment, and the labour market. The index shows the loss in potential human development due to inequality between male and female achievement in these dimensions. The index ranges from 0, which indicates that women and men fare equally, to 1, which indicates that women fare as poorly as possible in all measured dimensions. Reproductive health is measured by maternal mortality and adolescent fertility rates; empowerment is measured by both the share of parliamentary seats held by each gender and attainment at secondary and higher education by each gender; and the indicator measuring labour market is the labour market participation rates for each gender.

## Summary of Atlas Results

### *The Gender Inequality Index:*

- The Administrative Areas which scored the lowest in the GII were Tobago, San Fernando, Penal/Debe, and Diego Martin. The Mayaro/Rio Claro and Sangre Grande regions of Trinidad scored high in the GII. Therefore, gender inequalities were greater in the eastern regions of Mayaro/Rio Claro and Sangre Grande than in the areas of Tobago and Penal/Debe.

### *Adolescent Fertility Rate:*

- Sangre Grande had the highest Adolescent Fertility Rate at 75.2 per 1,000 women. Penal/Debe had the lowest at 28.9 per 1,000 women.

### *GI and the Labour Force Participation Rate:*

- The regions with the lowest Female Labour Force Participation Rates was Princes Town, while the highest was Tobago.

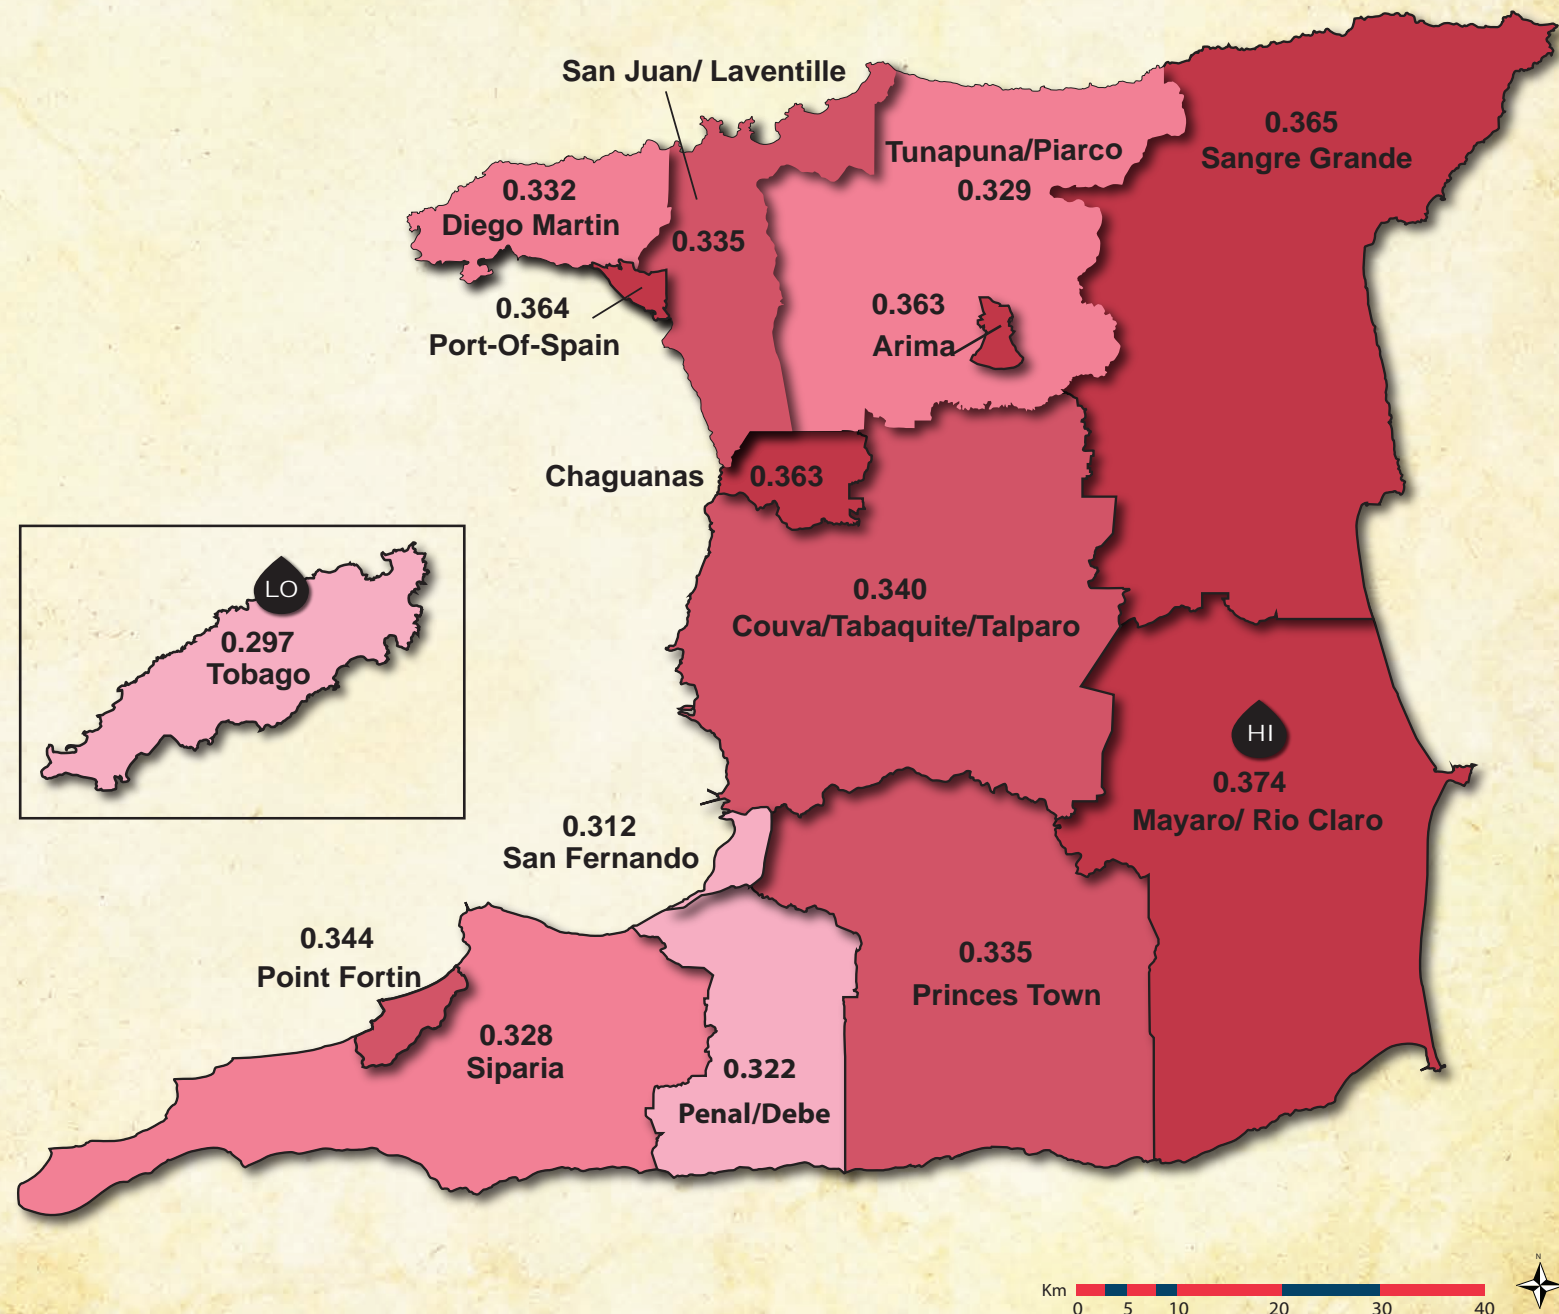

### *GI and the percentage of population with at least Secondary Education:*

- The region which had the highest percentage for the female population having at least secondary education was San Fernando while the lowest figure was recorded in the region of Mayaro/Rio Claro. Similarly, San Fernando also had the highest percentage for the male population having at least secondary education while Sangre Grande had the lowest figures in that regard.

## What are the limitations of the Gender Inequality Index?

The Gender Inequality Index faces major data limitations, which constrains the choice of indicators. For example, we use national parliamentary representation that excludes participation at the local government level and elsewhere in community and public life. The labour market dimension lacks information on incomes, employment and on unpaid work by women. The Index misses other important dimensions, such as time use – the fact that many women have the additional burden of care giving and housekeeping, which cut into leisure time and increase stress and physical exhaustion. Asset ownership, gender-based violence and participation in community decision-making are also not captured, mainly due to limited data availability.

## How is the GII calculated, and what are its main findings in terms of national and regional patterns of inequality?

There is no country with perfect gender equality – hence all countries suffer some loss in their HDI achievement when gender inequality is taken into account, through use of the GII metric. The Gender Inequality Index is similar in method to the Inequality-adjusted Human Development Index (IHDI). It can be interpreted as a percentage loss to potential human development due to shortfalls in the dimensions included. Since the Gender Inequality Index includes different dimensions than the HDI, it cannot be interpreted as a loss in HDI itself. Unlike the HDI, higher GII values indicate lower achievement. The world average score on the GII is 0.492, reflecting a percentage loss in achievement across the three dimensions due to gender inequality of 49.2%. Regional averages range from 31% in Europe and Central Asia, to 61% in Sub-Saharan Africa. At the country level losses due to gender inequality range from 4.9% in Sweden, to 76.9% in Yemen. Sub-Saharan Africa, South Asia and the Arab States suffer the largest losses due to gender inequality (61%, 60.1% and 56.3% respectively). Regional patterns reveal that reproductive health is the largest contributor to gender inequality around the world – women in Sub-Saharan Africa, with a massive 73% loss, suffer the most in this dimension, followed by South Asia (65.9%), the Arab States and Latin America and the Caribbean (each with 62.5% loss). The Arab States and South Asia are both also characterized by relatively weak female empowerment.

## What is the rationale for using indicators for health without equivalents for men?

It is true that reproductive health indicators used in the Gender Inequality Index do not have equivalent indicators for males. So in this dimension, the reproductive health of girls and women are compared to what should be societal goals—no maternal death, and no adolescent pregnancy. The rationale is that safe motherhood reflects the importance society attaches to women's reproductive role. Early childbearing, as measured by the adolescent fertility rate, is associated with greater health risks for mothers and infants; also, adolescent mothers often are forced out of school and into low-skilled jobs.

## How is the GII different from other recently released Gender indices?

The World Economic Forum's Global Gender Gap Index (GGI), released on November 1, 2011, differs from the Human Development Report's GII in many ways. First, the dimensions and indicators are different. Second, the GGI measures gender gaps without taking into consideration a country's level of development. In contrast, the GII shows the loss to potential achievement in a country due to gender inequality across reproductive health, empowerment and labour market participation. The Economist Intelligence Unit's Women's Economic Opportunity Index (WEOI) is also different in that it focuses on laws and regulations about women's participation in the labour market and social institutions that affect women's economic participation. It has five dimensions—labour policies and

practice, women's economic opportunity, access to finance, education and training, women's legal and social status, and general business environment. Each category or sub-category has four to five indicators. Like the OECD's Social Institutions and Gender Index (SIGI), the WEOI complements the GII by helping us understand the underlying causes of gender inequalities in economic participation.

## What is the policy relevance of the Gender Inequality Index?

The Gender Inequality Index provides insights into gender disparities in health, empowerment and labour market in 146 countries. It can be useful to help governments and others understand the ramifications of gaps between women and men. The Gender Inequality Index, as any other global composite index, is constrained by the need for international comparability; but it could be readily adapted for use at the national or local level.

# 1.4 MULTIDIMENSIONAL POVERTY INDEX (MPI)

*Data Source: Multiple Indicator Cluster Survey 2006 (MICS 3)*

The Multidimensional Poverty Index (MPI) identifies multiple deprivations at the individual level in health, education and standard of living. It uses micro data from household surveys, and unlike the Inequality-adjusted Human Development Index, all the indicators needed to construct the measure are derived from the same survey. Each person in a given household is classified as poor or non-poor depending on the number of deprivations his or her household experiences. These data are then aggregated into the national measure of poverty. The MPI reflects both the incidence of multidimensional deprivation, and its intensity—how many deprivations people experience at the same time. It can be used to create a comprehensive picture of people living in poverty, and permits comparisons both across countries, regions and the world and within countries by ethnic group, urban or rural location, as well as other key household and community characteristics. The MPI builds on recent advances in theory and data to present the first global measure of its kind, and offers a valuable complement to income-based poverty measures. The 2011 UNDP Human Development Report (HDR) presents estimates for 109 countries with a combined population of 5.5 billion (79% of the world total). About 1.7 billion people in the countries covered a third of their entire population lived in multidimensional poverty between 2000 and 2010.

The Multidimensional Poverty Index measures deprivation in terms of the three aforementioned dimensions – and comprises a total of 10 indicators as indicated in the diagram below.

The MPI therefore indicates the proportion of the population that are poor and the composition of their poverty. Thus, expanding on traditional measures of poverty such as national poverty lines. The MPI is calculated by multiplying the incidence or headcount ratio (H) of poverty – the proportion of the population that is multi-dimensionally poor – by the average intensity (A) of their poverty – the average proportion of indicators in which poor people are deprived.

In 2006 Trinidad and Tobago, had an overall ranking of 0.02 on the

MPI which was resultant from 5.6% of the population being poor, based on the dimensions of poverty considered with an average intensity of poverty of 35.1% of these poor persons. In addition, 0.4% of the population was vulnerable to poverty and 0.3% experienced severe poverty. This is shown in the table below.

Survey	Year	MPI Rank (MPI=H*P)	Incidence of Poverty (H)	Average Intensity across the Poor (A)	Percentage of Population vulnerable to poverty	Percentage of Population in Severe Poverty
Multiple Indicator Cluster Survey	2006	0.020	5.6%	35.1%	0.4%	0.3%

*Source: University of Oxford (2011) Country Briefing: Trinidad and Tobago – Multidimensional Poverty Index (MPI)*

## Summary of Atlas Results:

When the MPI data was disaggregated by administrative areas the following results were revealed:

### Overall Rank of Administrative Areas on the MPI:

- Sangre Grande and Princes Town had higher MPI figures, thereby indicating higher incidence and intensity of poverty. San Fernando and Tobago recorded the lowest values for the MPI indicating the opposite.

### Intensity of multidimensional Poverty:

- Tobago had the lowest intensity of poverty while Princes Town had the highest intensity based on the multi-dimensional poverty score.

### Proportion of the population who are multi-dimensionally poor (Headcount Ratio):

- Sangre Grande had the highest headcount ratio whilst San Fernando had the lowest.

### Intensity of multidimensional poverty for the health dimension:

- The health dimension of the MPI measured child mortality and adequate access to nutrition. Arima had the highest percentage of the population negatively affected by poverty due to these health related factors (24.3%) and Siparia was least affected with twelve percent.

### Intensity of multi-dimensional poverty for the education dimension:

- The education dimension measured the percentage of the poor population who had not completed five years of schooling and who had at least one school-age child not enrolled in school. Siparia was the area mostly disadvantaged by poverty due to these educational factors and therefore ranked the highest compared to Diego Martin which had the lowest ranking or was least affected.

### Intensity of multidimensional poverty for the standard of living dimension:

- The standard of living dimension measured the percentage of the poor population that had no access to electricity, clean drinking water, adequate sanitation, house had dirt floor, household used 'dirty' cooking fuel (dung, firewood or charcoal) and household had no car and owned at most one of the following: bicycle, motorcycle, radio, refrigerator, telephone or television. In the Standard of Living dimension, Siparia was once again the area most negatively affected by poverty in terms of standard of living whilst San Fernando was the least affected by poverty in relation to this dimension.

Intensity of Multidimensional Poverty for Standard of Living Dimension Indicators (2006)

## What is the Multidimensional Poverty Index?

The Multidimensional Poverty Index (MPI) identifies multiple deprivations at the individual level in health, education and standard of living. It uses micro data from household surveys, and unlike the Inequality-adjusted Human Development Index, all the indicators needed to construct the measure must come from the same survey. Each person in a given household is classified as poor or non-poor depending on the number of deprivations his or her household experiences. These data are then aggregated into the national measure of poverty. The MPI reflects both the incidence of multidimensional deprivation, and its intensity - how many deprivations people experience at the same time. It can be used to create a comprehensive picture of people living in poverty, and permits comparisons both across countries, regions and the world and within countries by ethnic group, urban or rural location, as well as other key household and community characteristics. The MPI builds on recent advances in theory and data to present

the first global measure of its kind, and offers a valuable complement to income-based poverty measures. The 2011 UNDP Human Development Report (HDR) presents estimates for 109 countries with a combined population of 5.5 billion (79% of the world total). About 1.7 billion people in the countries covered, a third of their entire population, lived in multidimensional poverty between 2000 and 2010.

## What makes a household “multidimensionally” poor?

One deprivation alone may not represent poverty. The MPI requires a household to be deprived in multiple indicators at the same time. A person is multidimensionally poor if the weighted indicators in which he or she is deprived add up to at least 20%.

## Why is income not included?

We could not include income due to data constraints. Income poverty data come from different surveys, and these surveys often do not have information on health and nutrition. For most countries we are not able to identify whether the same people are income poor and also deprived in all the MPI indicators.

## What are the policy implications?

The MPI methodology shows aspects in which the poor are deprived and help to reveal the interconnections among those deprivations. This enables policymakers to target resources and design policies more effectively. This is especially useful where the MPI reveals areas or groups characterized by severe deprivation.

## How do I interpret the various values presented with the MPI results?

The MPI constitutes a family or set of poverty measures. These measures can be unpacked to show the composition of poverty both across countries, regions and the world and within countries by ethnic group, urban/rural location, as well as other key household and community characteristics. This is why the Oxford Poverty & Human Development Initiative (OPHI) describes the MPI as a high resolution lens on poverty: it can be used as an analytical tool to identify the most prevailing deprivations. The MPI measures are explained below: Incidence of poverty: the proportion of people who are poor according to the MPI those who are deprived in at least 20% of the weighted indicators. Average intensity of poverty: the average number of deprivations people experience at the same time. MPI value: The MPI value summarizes information on multiple deprivations into a single number. It is calculated by multiplying the incidence of poverty by the average intensity of poverty.

## How is the MPI approach useful at the country level?

The multidimensional poverty approach can be adapted using indicators and weights that make sense at the country level to create tailored national poverty measures. The MPI can be useful as a guide to helping governments tailor a poverty measure that reflects multiple local indicators and data. In 2009 Mexico, became the first country to adopt a multidimensional poverty measure reflecting multiple deprivations at the household level.

## PART 2: MDG MAPS

The Millennium Development Goals agreed upon by all countries, including Trinidad and Tobago and leading development institutions, has only three years to the target date of meeting the needs of the world's poorest by 2015. The series of maps in this segment prepared with data from the Multiple Indicator Cluster Survey (MICS) of 2006 commissioned by the Ministry of Social Development in collaboration with UNICEF and the CSO; and the Trinidad and Tobago Household Budget Survey 2008-2009 provides an important data source for monitoring the 21 indicators of the Millennium Development Goals.

## PART 2: MILLENNIUM DEVELOPMENT GOALS (MDG) MAPS

*(Source Data – MICs 2006 & HBS 2008-2009)*

The maps present data for indicators relating to the MDG Goals 2, 4 and 7 (Universal Education, Child Health and Environmental Sustainability) and their selected targets. In some instances, proxy indicators were used.

At the administrative level, there was room for improvement in performance in relation to the indicators, however, overall, the country appears poised to achieve the relevant MDG targets for MDG goals, 2, 4 and 7. Of particular note was the overall underperformance of the rural administrative areas of Sangre Grande and Mayaro/Rio Claro.

## Summary of Atlas Results

In relation to Goal 2, whereas Trinidad and Tobago has achieved Universal Primary and Secondary Education, thereby ensuring access to schools by all children, the map shows that in the administrative areas of Mayaro/Rio Claro, Arima and Sangre Grande, the primary and secondary educational attainment rate for 6-16 year olds were 64.5, 71.1 and 79.9 respectively, which was lower than other administrative areas. Mayaro/Rio Claro had the lowest rate of all with a percentage education attainment rate of 72.9% for females and 57.6% for males (ages from 6 to 16). There may be need for further investigation of other factors apart from access to schools that could be affecting educational attainment by children.

In relation to Goal 4, most administrative areas recorded medium to high life expectancy at birth when compared to the national life expectancy of 73.22 years for both sexes as well as 70.17 years for males and 76.50 years for females. In the administrative area of Port of Spain however, children recorded a low life expectancy at birth (67.69) and also recorded the highest percentage of deaths for at least one child born per household. Arima and Mayaro/Rio Claro also recorded high percentages of households in which at least one child was born but later died. The factors impacting on the life span of infants in these areas must be further

examined and addressed. The data also showed that the consumption of iodized salt in the administrative area of Point Fortin was low, therefore indicating that children in this area may be at risk for Iodine Deficiency Disorder, which in turn can increase susceptibility to miscarriages and still births. Further investigation would be required in that area.

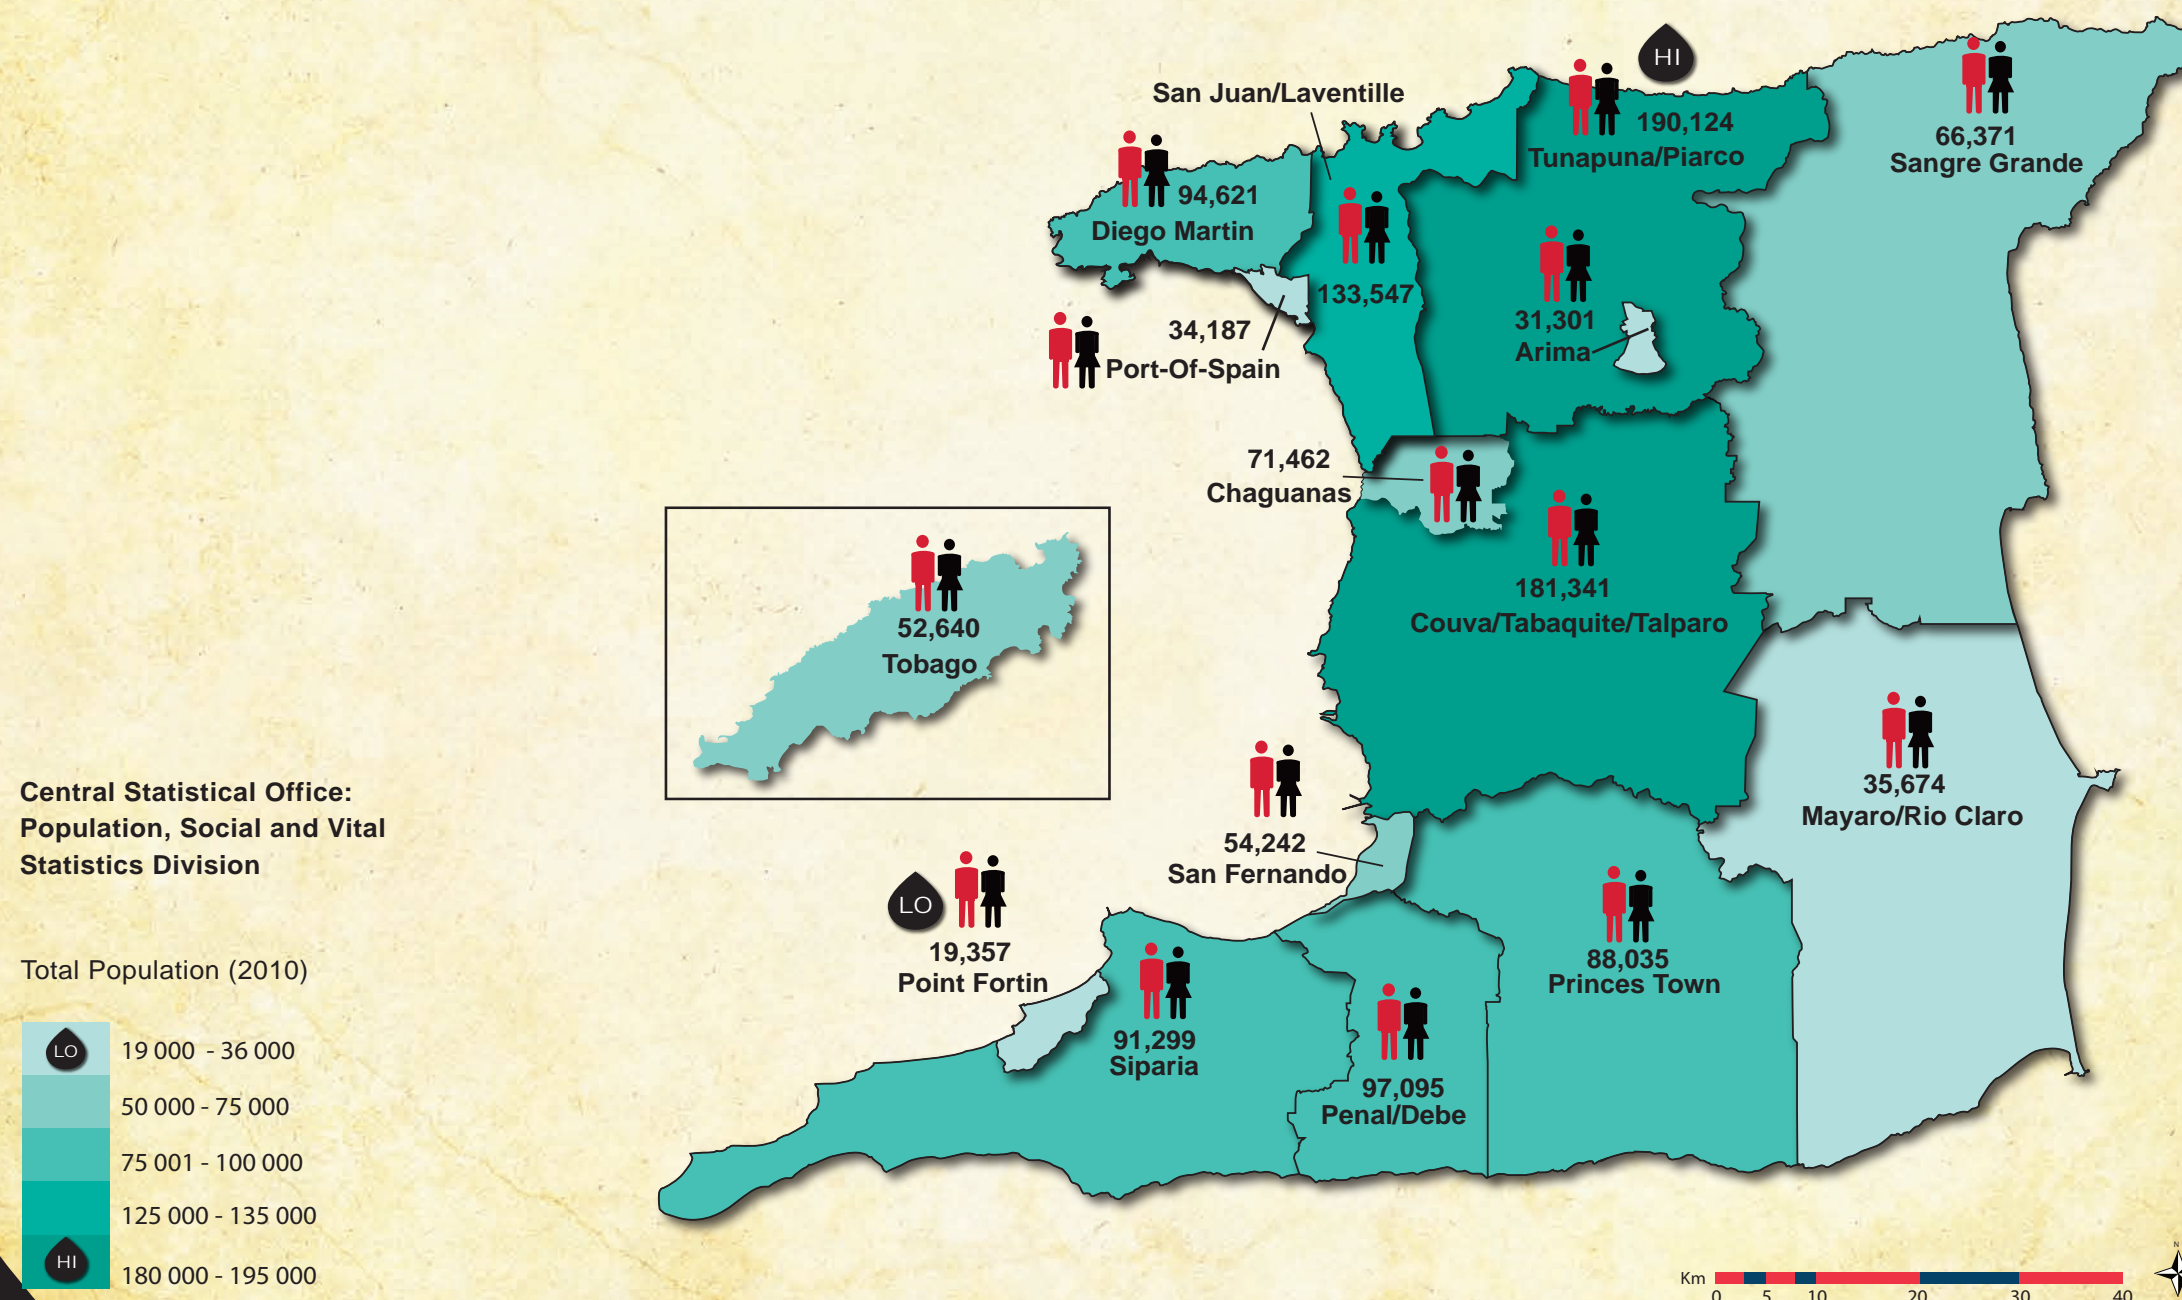

At the administrative level, in achieving Goal 7, there is considerable room for improvement, given that 6 administrative areas had high percentages of population without electricity, namely, Sangre Grande, Point Fortin, Princes Town, Mayaro/Rio Claro, Couva Tabaquite/Talparo and Siparia. Five administrative areas recorded medium to high percentages of the population without access to clean drinking water, namely; Penal/Debe, Princes Town, Diego Martin, Sangre Grande and San Juan/Laventille.

In relation to sanitation facilities, the only administrative area recording an acceptably low level of households without improved sanitation facilities was San Fernando (2.5%). The areas of San/Juan Laventille and Tobago, recorded the highest percentages of population without adequate sanitation facilities with 13.5% and 13.2% respectively. Medium levels of performance were recorded in the other administrative areas.

attainment rate refers to the percent-  
age of children between ages 6-16  
who have attained primary or  
secondary school level of education.

Primary and Secondary Education  
Attainment Rate (2008-2009)

# PART 3

## CRIME AND VIOLENCE MAPS

Crime and Violence continues to be one of the most critical areas that need to be addressed in the context of national development. Economic growth and meaningful democracy will not be possible unless crime and violence is brought under control and all citizens can feel safe and secure. The Crime and Violence Maps of this Atlas are based on crime and violence indicators developed from the Citizen Security Survey 2010 as well as data obtained from the Crime and Problem Analysis Unit (CAPA), of the Trinidad and Tobago Police Service.

## PART 3:

### Section 1: Citizen Security Survey

The objective of the study was to attain an in-depth understanding of why citizen security is so badly needed and why violence and insecurity is so prevalent. The findings of the citizen security survey, are represented in eight (8) broad areas in a collection of maps of disaggregated development trends across the Police Regions (Divisions) of Trinidad and Tobago. The eight (8) broad areas were as follows:

1. Actual Victimization within the Last 10 Years
2. Actual Victimization in 2009
3. Actual Victims of Sexual Assault in 2009
4. Frequency of Domestic Violence in Households
5. Crime in the Community
6. Fear of Crime
7. Police Effectiveness
8. Police Confidence

These maps also indicate the share of reported serious crimes as well as the number of these serious crimes per 100,000 persons, both as a whole and disaggregated by type and by Police Division. Serious crimes include burglaries and break-ins, robberies, general larceny, murder, wounding and shootings, rapes, incest and sexual offences, larceny of motor vehicles, fraud offences, larceny of dwelling houses, narcotic offences, and other serious crimes. Moreover, it is important to note that the data referred to the events of 2010 and was provided by the Crime and Problem Analysis Unit (CAPA) of the Trinidad and Tobago Police Service.

### 1. Actual Victimization within the Last 10 Years

Within the last ten (10) years, the survey revealed a variation of the level of persons who were victims of crimes. In Trinidad, the Western Division experienced the most crimes (52.1%) while the South Western Division experienced the least (16%) within the last 10 years. The Tobago Division compared to all other areas, responded to having had the lowest percentage of victims of crime (7.9%).

Over the ten (10) year period, the average person within each Division would have been a victim of crime at least once, with persons in the Western Division experiencing the highest level of crime at least once at 22.5%.

### 2. Actual Victimization in 2009

In 2009, the Divisions with the highest number of persons that stated they were victims of crime were Port of Spain (23.5%), North Eastern (18.2%) and Central (12.8%). In relation to members of a household who experienced

crime, it was revealed that at least one (1) person within each family for persons living in the Western Division and the Port of Spain Division experienced crime within the last year (2009). However, even though persons were a victim of crime, the reporting of such incidents were much less in several high incident areas of crime, namely Port of Spain, North Eastern, Western and Central.

### 3. Actual Victims of Sexual Assault in 2009

In 2009, the survey also revealed that the highest level of sexual assault was in the Northern Division (2%), with several Divisions having 0% of sexual assault (South Western, Western, and North Eastern).

### 4. Frequency of Domestic Violence in Households

The survey indicated that the Eastern Division (7.9%) had the highest percentage of domestic violence. The Eastern Division was also reported as having one of the highest frequencies of verbal threats of violence (7.4%). The Divisions with the lowest incidents of domestic violence surveyed were North Eastern, Western and Tobago.

In relation to the frequency of physical injury by households the survey revealed that the Eastern Division had the highest frequency of persons physically injured (cuts, scratches and bruises) from a partner (6.5%). The Western Division had the highest frequency of verbal abuse (19.7%); and the Eastern Division had the highest frequency of physical abuse (pushing, shaking, hitting kicking) from a partner (7.9%).

## 5. Crime in the Community

The UNDP's Citizen Security Survey 2010, also showed that the Division with the highest percentage of respondents acknowledging crime as a problem in their division is the Western Division with Tobago having the smallest percentage. The North Eastern Division recorded the highest percentage (21.2%) for the number of times that crimes occurred frequently in the community.

Additionally, in relation to the existence of criminal gangs in neighbourhoods, the survey revealed that within each Police Division, a criminal gang was believed to be existing. In spite of gangs existence within each community, over 60% of respondents reported that they experienced no incidents of gang violence within their particular police division.

## 6. Fear of Crime

Over the past year, Tobago was reported as the Division with the highest level of persons feeling very secure (12.6%), with little fear of the possibility of becoming a victim of crime. However, respondents in the Western Division (12.7%) and the South Western Division (12%) indicated that they were very insecure about the possibility of becoming a victim of crime. As a result, respondents also stated that their perception of the Police Force as having the capability to manage the problem of insecurity was insufficient with the North Eastern (60.6%), Tobago (53.3%), Southern (50.3%) and Port of Spain (49.4%) perceived as having the least capability.

## 7. Police Effectiveness

As it relates to the police force becoming more effective, less effective or remaining the same within their respective communities, more respondents viewed police effectiveness as insufficient. At the national level, the Divisions reported as being less effective were Port of Spain (49.4%), Northern (44%), and Central (42.4%).

## 8. Police Confidence

Respondents were asked to state their level of confidence in the police effectively responding to emergency calls. The North Eastern Division (60.6%) ranked the highest and Port of Spain (43.5%) the lowest in terms of having some confidence in the police. However, as it relates to confidence in the police to control crime, all Divisions expressed high levels of no confidence, with respondents having the least confidence in the Northern Division (52.4%). The North Eastern Division respondents had the most confidence compared to other Divisions but also recorded a low level of confidence by respondents (36.4%).

## PART 3:

### Section 2: Crime and Violence

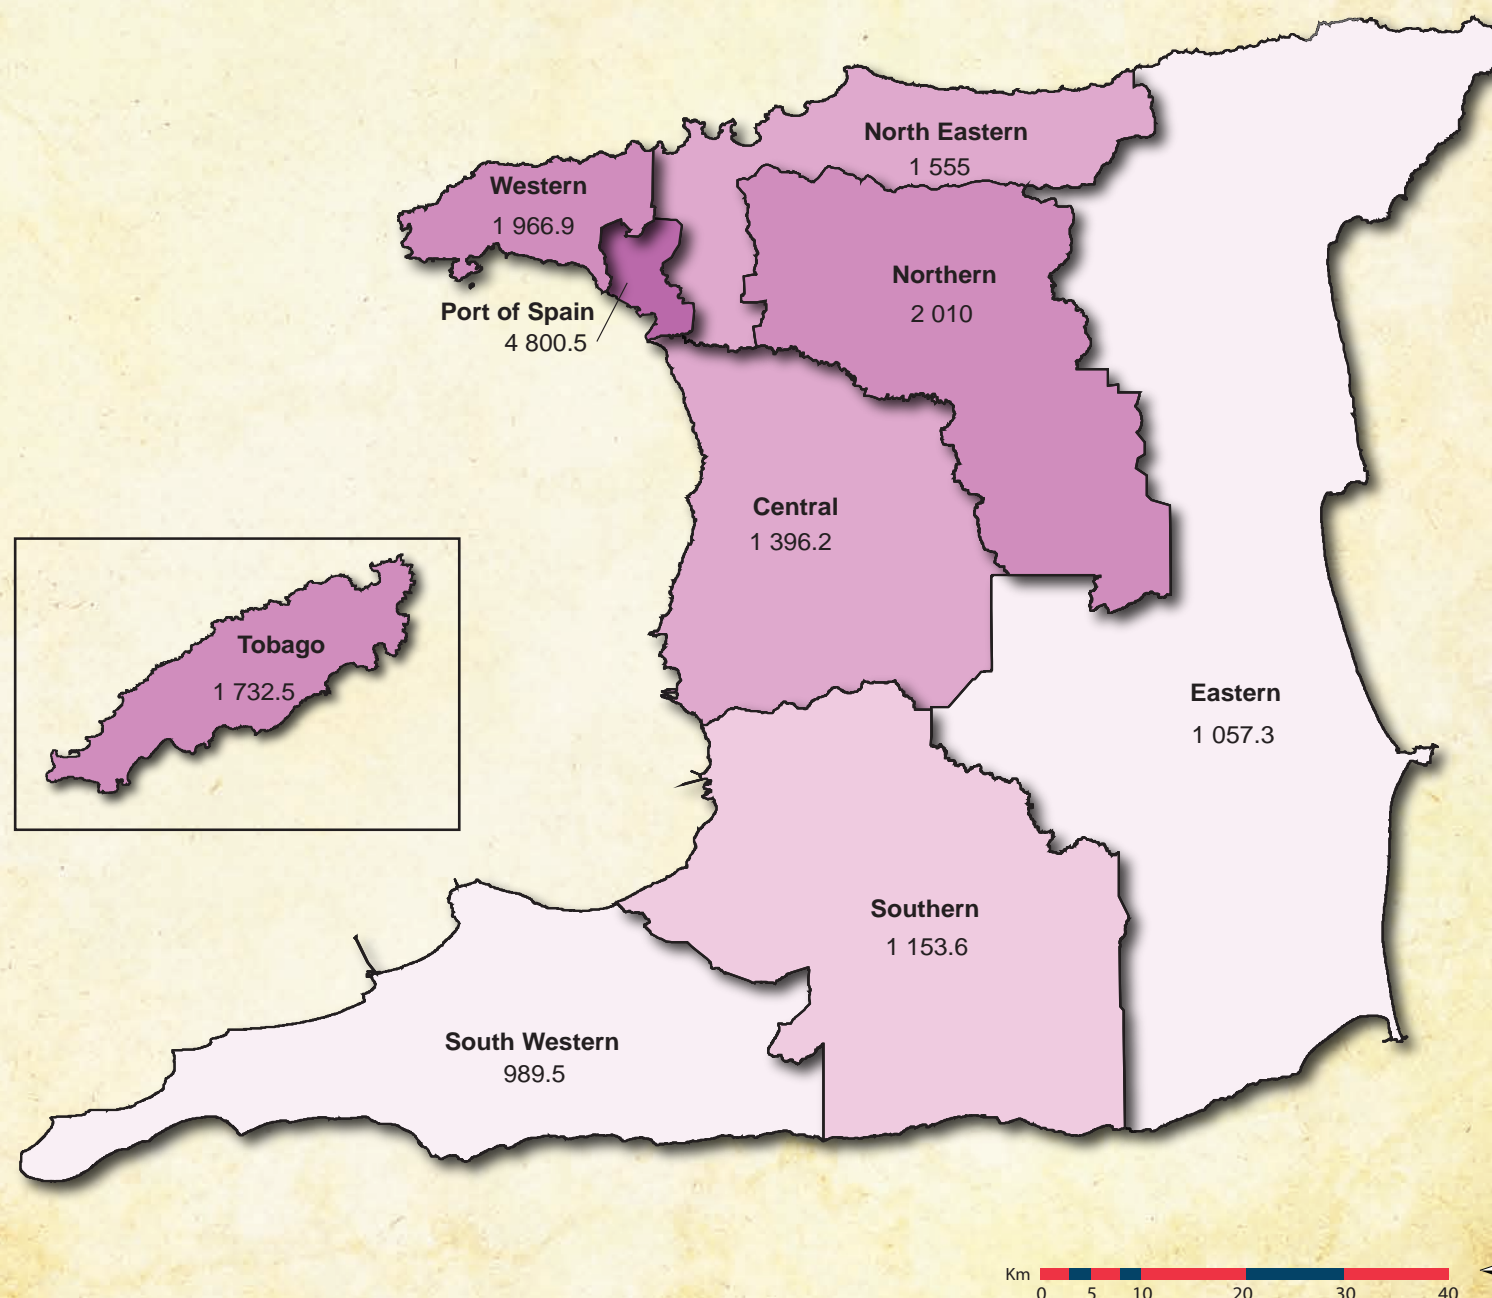

#### Summary of Atlas Results

- According to the map illustrating the 'Share of Serious Crimes by the Type of Crime' the main crime concerns in Trinidad and Tobago included burglaries and break-ins, robberies and general larceny, as these were the most prevalent types of serious crime overall in each Police Division. In Port of Spain alone there were 1,002.8 reported burglaries and break-ins, 1,391.8 reported robberies and 1,188.7 reported cases of General Larceny per 100,000 persons.
- The Port of Spain Division also recorded the highest reported levels of the motor vehicle and dwelling house larceny (275.5 and 107.1 respectively), murders (146.4), woundings and shootings (255.1), serious indecency (22), kidnappings (14.2) and fraud offences (37.8) per 100,000 persons.
- By comparison, the Eastern Division had the highest number of reported cases of rape, incest and other sexual offences at 132.2 per 100,000 persons and narcotic offences at 102.4 cases per 100,000 persons. In spite of this, the Eastern Division had the lowest number of reported cases of general larceny, robberies and larceny of dwelling houses at 123.2, 191.8 and 19.9 per 100,000 persons respectively. With respect to burglaries and break-ins, the Southern Division had the least reported cases at 286.4.

# PART 5

## HAZARD AND DISASTER RELATED MAPS

The Office of Disaster Preparedness and Management (ODPM) is pleased to have been able to collaborate with the CSO and the UNDP in the production of the Trinidad and Tobago Human Development Atlas. ODPM's contribution to the Atlas represents a milestone in our ability to represent hazard and disaster related data in a user-friendly, non-technical format to a large array of stakeholders. It also provides a national snapshot of Trinidad and Tobago's hazard experience over a considerable period of years.

The comparative analysis across regions within Trinidad and Tobago will concurrently visually emphasize the baseline with respect to hazard experience in the country based on historical records and highlight the areas in need of transformation. This is undoubtedly a step in the right direction in informing public policy and decision making at a national level, with the ultimate goal of reducing disaster risk and improving in a measurable way, the resilience of our communities and nation as a whole.

## PART 5: HAZARD AND DISASTER RELATED MAPS

### 1. MAP TITLE:

Trinidad & Tobago Flood Impacted Communities  
(1999-2011)

### Map Summary:

Map shows flood impacted communities in Trinidad & Tobago based on historical data (1999-2011). Past frequency and severity of reported flood incidents for the noted period was aggregated and the data was ranked to show the degree of impact (High, Medium, and Low) in affected communities.

**Source:** ODPM

**Data Credits:** CSO, Dr Bheshem Ramlal, TEMA, ODPM

**Disclaimer:** This product is intended for reference only. The ODPM assumes no liability for errors omissions, or inaccuracies in the furnished product/data

### 2. MAP TITLE:

Trinidad & Tobago Hazard Impact (2006-2011) by  
Administrative Areas

### Map Summary:

Map shows level of hazard impact by administrative boundaries for Trinidad & Tobago. Hazard impact is a derivative of past frequency and severity of all recorded natural and anthropogenic hazard incidents, including but not limited to flood, landslide, high wind events and fire aggregated from (2006-2011) and ranked accordingly - High, Medium, Low Impact. The map also attempts to illustrate via pie charts, the prevalence of the (overall) 4 most common hazards in each administrative area. Additionally, the size of the pie chart is an indication of the frequency of hazard events per area.

**Source:** ODPM

**Data Credits:** CSO, Dr Bheshem Ramlal, TEMA, ODPM

### 3. MAP TITLE:

#### Landslide Susceptibility - Trinidad

### Map Summary:

#### Method

The landslide susceptibility map was produced using Multi-Factor Modeling (MFM). GIS layers of Landslide instability factors were first generated. The factors considered are slope angle, lithological formation, tectonic features, land use, drainage network, road network, and rainfall. The characteristic of the elements of each of these factors were classified and ranked into three (3) levels of susceptibility to Landslides. The five (5) classes are: very low, low, moderate, high, and very high.

The MFM is a logical model that is easy to apply especially when records of past incidents are lacking in detail such as geographic coordinates of location, extent, magnitude, date and time of occurrence. Each of the factors were also assigned a numeric weight based on their relative magnitude of landslide causative. The weights were assigned based on the professional knowledge of reviewers.

The MFM incorporates the assistive influence of higher susceptibility level of the instability factors to produce the susceptibility map. GIS data model was built to perform weighed additive overlay of all the ranked instability factors (layers) to produce the Landslide susceptibility map. The output layer was ranked and reclassified into three (3) levels of susceptibilities: low, moderate, high, using natural break classifier function in Arc Map.

#### Verification of Results

Verification was performed using cross-validation and ground trusting techniques. Cross validation technique entails spatial overlay of the susceptibility map produced on the past incident layer generated. A very high visual goodness of fit was obtained. This was followed by field ground thrusting. Field crews visited areas of High and Very High susceptibility level to confirm incidences of landslides that occurred during this study and were able to confirm that these new cases occurred in areas of High and Very High only.

#### Limitations of Methods and Data

The MFM itself is sound and logical. The results obtained from this study area are however affected by the inadequacies in the occurrence data. Since landslide susceptibility mapping is an ongoing process, it is hoped that future mapping will benefit from a more detailed occurrence database. This will also allow for the use of more rigorous statistical methods such as generated weighed regression and Probabilistic-Frequency Ratio Model (PFR). The result could also be improved through the use of correct land use data (2007 land use data was used for this study). The method also used annual mean rainfall whereas rainfall intensity would have been more appropriate. The assignment of weights to each of the factors is subjective as this was based on practical experience. A less biased weighing can be developed if the incidence data is more detailed and the PFR model is used.

### Limitation of Use

The Landslide susceptibility map may be used for:

- Regional landuse planning and zoning
- Landuse mitigation planning
- Public education and awareness programme
- Land development planning
- Emergency response planning (CERT)

### The Landslide susceptibility map should not be used for:

- Predicting landslide occurrence
- Detail site analysis and evaluation
- Property assessment

### 4. MAP TITLE:

Flood Susceptibility - Trinidad

### Map Summary:

#### Method

Flood susceptibility map was produced using Multi-Factor Modeling (MFM). GIS layers of flood inundation factors were first generated. The factors considered are: rainfall, elevation, slope, drainage density, road density, and land Use. The characteristics of the elements of each of these factors were classified and ranked into five (5) levels of susceptibility to flooding. The five (5) classes are: very low, low, moderate, high, and very high.

The MFM is a logical model that is easy to apply especially when records of past incidents of floods are lacking in detail such as geographic coordinates of location, extent, magnitude, date and time of occurrence. Each of the factors was also assigned a numeric weight based on their relative magnitude of flood causatives. The weights were assigned based on the professional knowledge of reviewers.

The MFM incorporates the assistive influence of higher susceptibility level of the instability factors to produce the susceptibility map. GIS data mode was built to perform weighed additive overlay of all the ranked inundation factors (layers) to produce the flood susceptibility map. The output layer was ranked and reclassified into three (3) levels of susceptibilities: low, moderate, high using natural break classifier function in ArcMap.

### Verification of Results

Verification was performed using cross-validation and ground trusting techniques. Cross validation technique entails spatial overlay of the susceptibility map produced on the past incident layer generated. A very high visual goodness of fit was obtained. This was followed by field ground thrusting. Field crews visited areas of High and Very High susceptibility level to confirm incidences of landslides that occurred during this study and were able to confirm that these new cases occurred in areas of High and Very High only.

### Limitations of Methods and Data

The MFM itself is sound and logical. The results obtained from this study area are however affected by the inadequacies in the occurrence data. Since landslide susceptibility mapping is an ongoing process, it is hoped that future mapping will benefit from a more detailed occurrence database. This will also allow for the use of more rigorous statistical methods such as generated weighed regression and Probabilistic-Frequency Ratio Model. The result could also be improved through the use of correct landuse data (2007 landuse data was used for this study). The method also used annual mean rainfall whereas rainfall intensity would have been more appropriate. The assignment of weights to each of the factors is subjective as this was based on practical experience. A less biased weighing can be developed if the incidence data is more detailed and the PFR model is used.

# ANNEX 1: GRAPHS

## Summary:

Graphs presented in this section illustrate the relationship between different indicators related to level of Human Development and Inequalities, Millennium Development Goals and Crime. The sizes of markers represent (are proportional to) the populations of Regional Corporations.

One of the graphs is devoted to clustering the Regional Corporations. The graph shows how the Regional Corporations are grouped based on their level of Human Development and Inequalities. Colors of the markers represent the different groups of Regional Corporations depending on their level of Human Development and Inequalities.

Most of graphs are devoted to the investigation of the relationship between indicators, using Ordinary Least Squares (OLS) Regression Model. These graphs will help the reader to review the relationship between the well-being and the existing problem: for example, relationship between education level and child mortality level of Regional Corporations or relationship between life expectancy at birth and level of victimization of Regional Corporations.

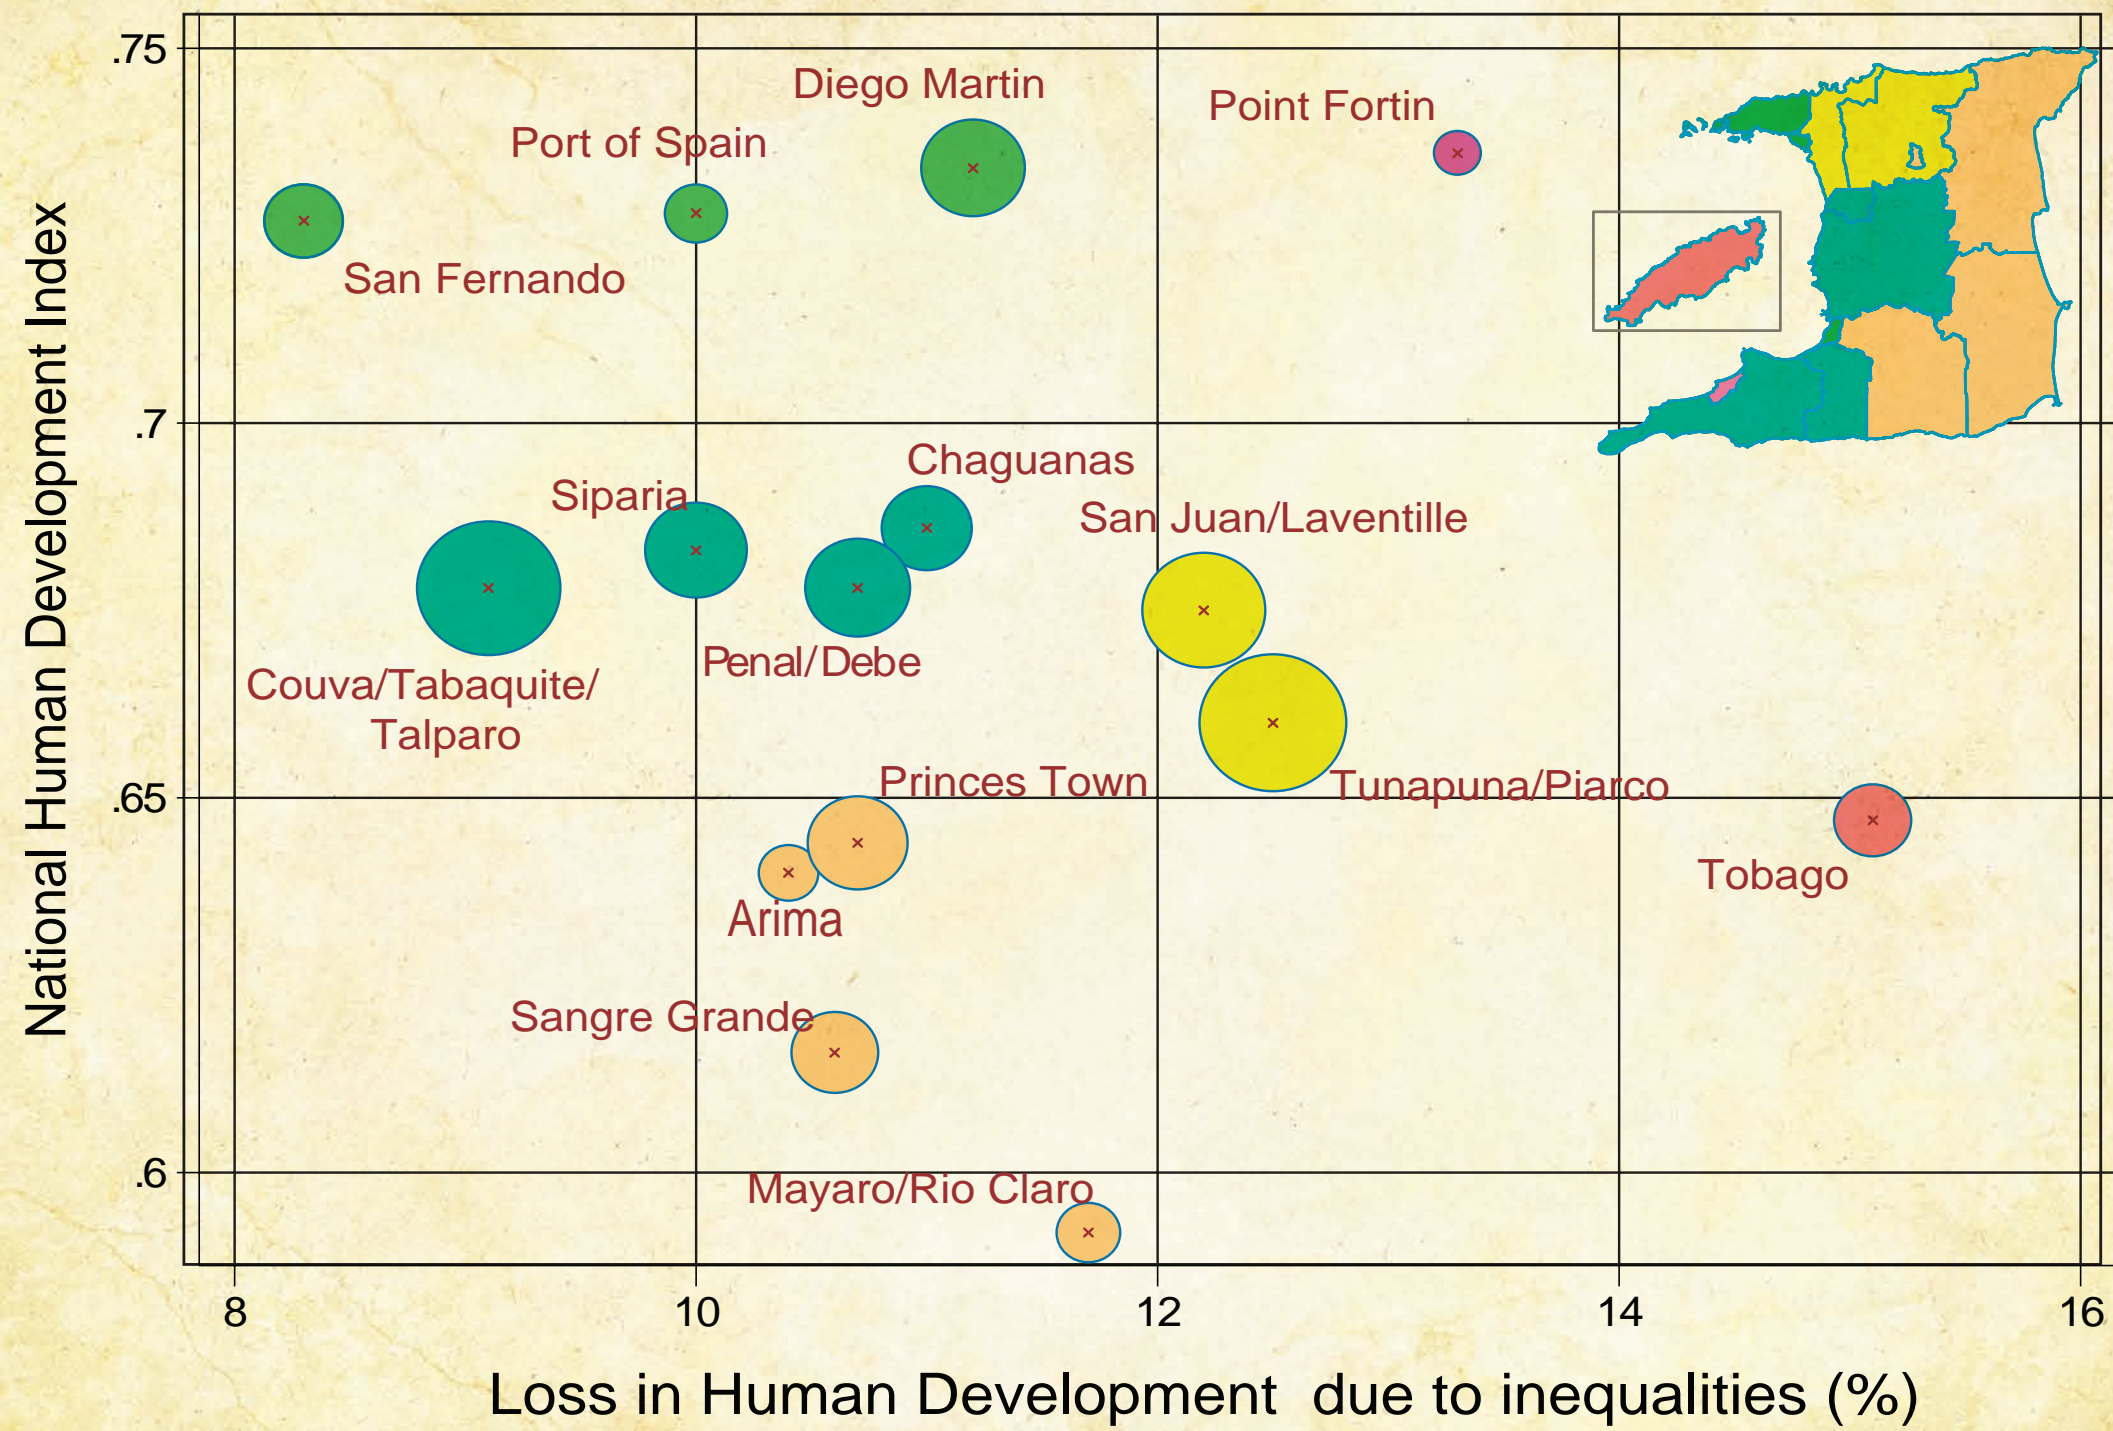

The graphs contain the fit curves and the equation of the fit curves obtained using the OLS Regression Model. According to the model the fit curve is where Regional Corporations should be in the graph or where Regional Corporations are estimated and expected to be in the graph. The deviation of Regional Corporations from the curve is explained by the influence of a number of random factors during the period of observation. According to the model, the indicator value of the Regional Corporation deviates from the curve or from where it is expected to be, because of a number of random factors, every one of which had small influence on the indicators' value.

The first curves in the graphs will help the reader to review and analyze the trends. The colors of markers will help the reader to identify the Regional Corporations that are included in the model and the Regional

Corporations that are not included. In case of linear models, estimation using the fit curves obtained from the OLS Regression Model has theoretically proved to be the best unbiased linear estimation. "Unbiased" means, we expect the indicator values to fall on the fit curve.

The graphs contain  $R^2$  (R-squared) measure that is called coefficient of determination.  $R^2$  measure shows how well the regression line approximates the actual values of indicators and gives us the information about the goodness of fit of the model. The value of  $R^2$  measure ranges from 0 to 1. If the value of  $R^2$  measure is equal to 1, it indicates that the model perfectly fits the real values of indicators. In the case where the value of  $R^2$  measure is equal to 0, it indicates that the model does not fit the real values of indicators at all.

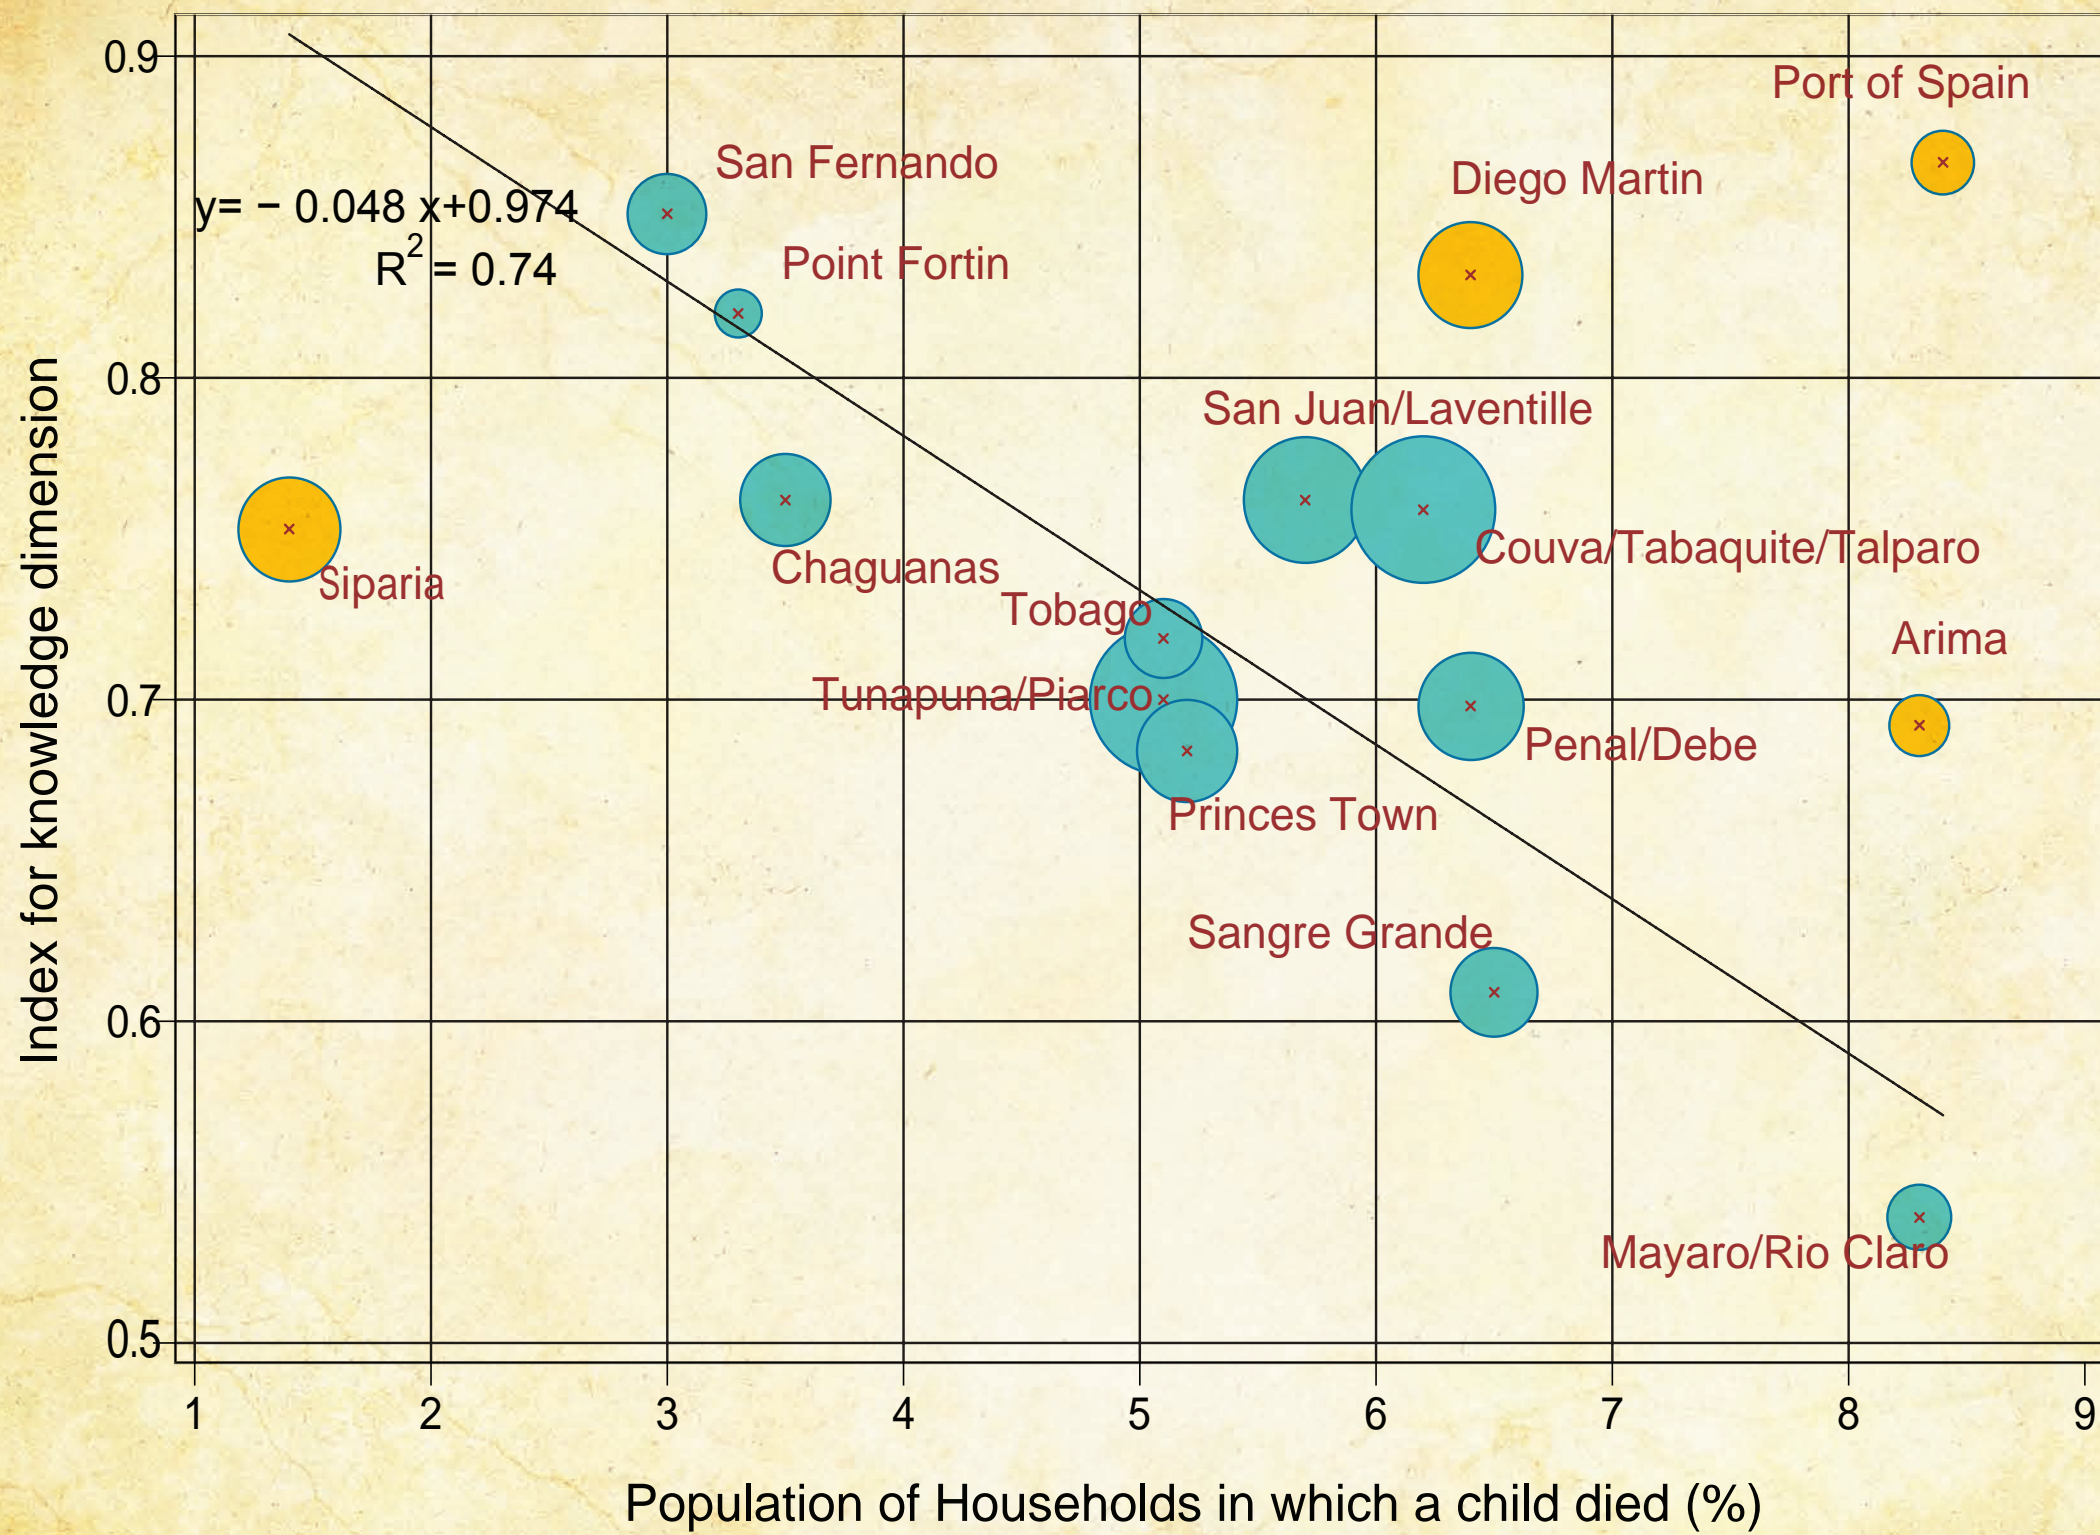

## ANNEX 2: DATA TABLES USED FOR THE PREPARATION OF THE MAPS INCLUDED IN THE ATLAS

### 1.1 National Human Development Index. Dimension Indicators

Regional Corporations	Population with chronic illnesses (%)	Primary and Secondary Educational Attainment Rate (% ages from 6 to 16)	Secondary and Higher Educational Attainment Rate (% ages 17 and above)	Household income per capita per year (US\$ according to 2005 PPP\$ conversion rate)

# ANNEX 3:

## TECHNICAL NOTE ON THE CALCULATION OF THE NATIONAL HUMAN DEVELOPMENT INDEX FOR TRINIDAD AND TOBAGO

National Human Development Index (NHDI) is a summary measure of human development. It measures the average achievements in three basic dimensions of human development: health, knowledge and a decent standard of living. NHDI was developed by Central Statistical Office and UNDP during the Human Development Mapping Exercise. National Human Development Index (NHDI) was calculated using indicators from Household Budget Survey, 2008-2009.

### Dimensions

#### Long and healthy life

**X** - Population with chronic illnesses (%)

#### Knowledge

**Y1** - Primary and Secondary Educational Attainment Rate (% ages from 6 to 16)

**Y2** - Secondary and Higher Educational Attainment Rate (% ages 17 and above)

#### A decent standard of living

**Z** - Household income per capita per year (US\$ according 2005 PPP conversion rate - 4.61 <http://unstats.un.org/unsd/mdg/SeriesDetail.aspx?srid=699>)

Goalposts Indicators	Worst	Best
Population with chronic illnesses (%)	50	5
Primary and Secondary Educational Attainment Rate (% ages from 6 to 16)	10	100
Secondary and Higher Educational Attainment Rate (% ages 17 and above)	10	100
Household income per capita per year (USD according PPP conversion rate for 2005)	100	43 017 <sup>(1)</sup>

<sup>(1)</sup> GNI per capita for USA (constant 2005 PPP\$). Source: Global HD Report 2011

The NHDI is the geometric mean of normalized indices measuring achievements in each dimension.

$$HDI = \sqrt[3]{I_X * I_Y * I_Z}$$

Health index:

$$I_X = \frac{X - 50}{5 - 50}$$

Education index:

$$I_Y = \sqrt{\frac{Y1 - 10}{100 - 10} * \frac{Y2 - 10}{100 - 10}}$$

Income index:

$$I_Z = \frac{\ln(Z) - \ln(100)}{\ln(43017) - \ln(100)}$$

# ANNEX 4:

## TECHNICAL NOTE ON THE CALCULATION OF THE INEQUALITY ADJUSTED NATIONAL HUMAN DEVELOPMENT INDEX FOR TRINIDAD AND TOBAGO

The Inequality-adjusted National Human Development Index adjusts the National Human Development Index for inequality in distribution of each dimension across the population. NHDl was developed by Central Statistical Office and UNDP during the Human Development Mapping Exercise. Inequality-adjusted National Human Development Index (NHDl) was calculated using indicators from Household Budget Survey, 2008-2009.

### Dimensions

#### Long and healthy life

**X** - Population with chronic illnesses (%) for Regional Corporation

$X_1, X_2, \dots, X_n$  - Population with chronic illnesses (%) for sub-population groups that constitute the Regional Corporation.

$m_1, m_2, m_3, \dots, m_n$  - the population size in each sub-population group accordingly.

#### Knowledge

**Y** - Primary and Secondary Educational Attainment Rate (% ages from 6 to 16) or Regional Corporation

$Y_1, Y_2, \dots, Y_n$  - Primary and Secondary Educational Attainment Rate (% ages from 6 to 16) for sub-population groups that constitute the Regional Corporation.

$m_1, m_2, m_3, \dots, m_n$  - the population size in each sub-population group accordingly.

**U** - Secondary and Higher Educational Attainment Rate (% ages 17 and above) for Regional Corporation.

$U_1, U_2, \dots, U_n$  - Secondary and Higher Educational Attainment Rate (% ages 17 and above) for sub-population groups that constitute the Regional Corporation.

$m_1, m_2, m_3, \dots, m_n$  - the population size in each sub-population group accordingly.

#### A decent standard of living

**Z** - Household income per capita per year (US\$ according 2005 PPP conversion rate - 4.61 <http://unstats.un.org/unsd/mdg/SeriesDetail.aspx?srid=699>) for Regional Corporation.

$Z_1, Z_2, \dots, Z_n$  - Household income per capita per year for sub-population groups that constitute the Regional Corporation.

$m_1, m_2, m_3, \dots, m_n$  - the population size in each sub-population group accordingly.

If we denote **N** as total number of population for all group then N is defined as follows:

$$N = m_1 + m_2 + m_3 + \dots + m_n$$

Inequality adjusted Human Development Index (IHDI) is calculated using HDI:

$$IHDI = \sqrt[3]{(1 - A_{Health}) * (1 - A_{Education}) * (1 - A_{Income})} * HDI$$

$A_{Health}$ ,  $A_{Education}$ ,  $A_{Income}$  - the losses due to inequality in dimensions (Long and healthy life, Education and a Decent standard of living dimensions)

$$A_{Health} = 1 - \frac{\sqrt[N]{X_1^{m_1} * X_2^{m_2} * ... * X_n^{m_n}}}{\bar{X}}$$

$$A_{Education} = 1 - \sqrt{(1 - A_Y) * (1 - A_U)}$$

$$A_Y = 1 - \frac{\sqrt[N]{Y_1^{m_1} * Y_2^{m_2} * ... * Y_n^{m_n}}}{\bar{Y}} \quad A_U = 1 - \frac{\sqrt[N]{U_1^{m_1} * U_2^{m_2} * ... * U_n^{m_n}}}{\bar{U}}$$

$$A_{Income} = 1 - \frac{\sqrt[N]{Z_1^{m_1} * Z_2^{m_2} * ... * Z_n^{m_n}}}{\bar{Z}}$$

Regional Corporations	National HDI	Inequality adjusted National HDI	Loss in Human Development (%)
Port of Spain	0.728	0.655	10.0
San Fernando	0.727	0.666	8.3
Arima	0.640	0.573	10.4
Chaguanas	0.686	0.610	11.0
Point Fortin	0.736	0.638	13.3

Trinidad and Tobago	0.677	0.607	10.3

# ANNEX 5

## TECHNICAL NOTE ON THE CALCULATION OF THE GENDER INEQUALITY INDEX FOR TRINIDAD AND TOBAGO

The Gender Inequality Index (GII) reflects women's disadvantage in three dimensions—reproductive health, empowerment and the labour market—for as many countries as data of reasonable quality allow. The index shows the loss in human development due to inequality between female and male achievements in these dimensions. It ranges from 0, which indicates that women and men fare equally, to 1, which indicates that women fare as poorly as possible in all measured dimensions. Gender Inequality Index was calculated using indicators provided by Central Statistical Office and Parliament.

### Dimensions

#### Health

$X$  - Maternal mortality ratio (per 100 000 live births)

$V$  - Adolescent fertility rate (per 1,000 women ages 15 – 19)

#### Empowerment

$Y_F$  - Female population with at least secondary education (% ages 25 and older)

$Y_M$  - Male population with at least secondary education (% ages 25 and older)

$U_F$  - Female shares of parliamentary seats (%)

$U_M$  - Male shares of parliamentary seats (%)

#### Labour market

$Z_F$  - Female labour force participation rates (%)

$Z_M$  - Male labour force participation rates(%)

$$GII = 1 - \frac{H}{A}$$

$$A = \frac{1}{2} * \sqrt[3]{\left(\sqrt{\frac{10}{X} * \frac{1}{V}} + 1\right) * (\sqrt{Y_F * U_F} + \sqrt{Y_M * U_M}) * (Z_F + Z_M)}$$

$$H = \left( \frac{(G_F)^{-1} + (G_M)^{-1}}{2} \right)^{-1}$$

$$G_F = \sqrt[3]{\left(\frac{10}{X} * \frac{1}{V}\right)^{1/2} * (Y_F * U_F)^{1/2} * Z_F} \quad G_M = \sqrt[3]{1 * (Y_M * U_M)^{1/2} * Z_M}$$

## ANNEX 6:

# TECHNICAL NOTE ON THE CALCULATION OF THE MULTIDIMENSIONAL POVERTY INDEX FOR TRINIDAD AND TOBAGO

The Multidimensional Poverty Index is based on the concept of multiple deprivations. The MPI allows us to identify the poor, excluded and vulnerable group of population and to measure the level of poverty and deprivation of the vulnerable groups using dimension indicators. For MPI calculation, household survey data is used.

The MPI value is the product of two measures: Multidimensional Headcount Ratio (**H**) and Intensity of Poverty (**A**):

$$MPI = H * A$$

**H** - Multidimensional Headcount Ratio is the proportion of population who are multidimensionality poor. **A** - Intensity of Poverty of poor population. It is equal to the mean of Intensity of Poverty of Poor population.

MPI sets multiple deprivations for individuals in education, health and standard of living. Multiple dimension poverty level of individual is defined by the Intensity of Poverty. Depending on the level of poverty deprivation, Intensity of Poverty for individual varies from **0** to **1**. The Intensity of Poverty that equals to **1** represents the case when the individual is deprived in all dimension indicators, i.e. the individual is absolutely “poor”. When the Intensity of Poverty equals to **0**, the individual is not deprived in all dimension indicators, i.e. the individual is absolutely “non-poor”. The Intensity of Poverty can be expressed in percentages and vary accordingly from **0 %** to **100%**. The Intensity of Poverty for population group is defined as the mean of intensities of individuals pertaining to the group.

A cut-off of value for Intensity of Poverty value is used to distinguish between the poor and non-poor. Household members with the Intensity of Poverty greater than or equal to the cut-off of value is considered multidimensionally poor. MPI for Trinidad and Tobago uses cut off value equal to **20 %**. MPI Trinidad and Tobago was calculated from Multi Indicator Cluster Survey III (2006).

### Dimensions, indicators and weights used for the calculation of Multidimensional Poverty Index

Dimensions	Weights for dimensions	Indicators	Weights for indicators	Considered Deprived
Health	1/3	Child Mortality	1/6	If any child has died in the household.
		Nutrition: Iodized salt Birth weight	1/12	If household is not using adequately iodized salt.
			1/12	if low birth weight infant is observed in the household
Education	1/3	Years of Schooling	1/6	If no household member has completed 5 years of schooling
		Child School Attendance	1/6	If any school-aged child (6-12 years) is out of school
Standard of Living	1/3	Electricity	1/18	If household does not have electricity
		Sanitation	1/18	The household's sanitation facility is not improved or it is improved but shared with other households ( the toilet is shared)
		Drinking water	1/18	The household does not have access to clean drinking water or clean water is more than 30 minutes walking from home.
		Flooring	1/18	If the floor is dirt, sand, or dung
		Cooking Fuel	1/18	If they cook with wood, charcoal, or dung
		Assets	1/18	If do not own more than one of: radio, TV, telephone, bike, motorbike or refrigerator and do not own a car or truck.

# GLOSSARY & BIBLIOGRAPHY

# GLOSSARY

<b>Administrative Area</b>	An administrative area, sub-national entity, or country subdivision is a portion of a country or other political division, established for the purpose of government.
<b>Adolescent Fertility Rate (indicator)</b>	Number of births to women ages 15–19, expressed per 1,000 women of the same age.
<b>Birth Weight (indicator)</b>	One of two sub-indicators which make up the primary indicator of Nutrition in the Multidimensional Poverty Index. It describes the weight of an infant at birth; and implies deprivation in Nutrition if low values are observed in a household.
<b>Child School Attendance (indicator)</b>	An Education indicator for the Multidimensional Poverty Index which describes the percentage of school-aged children (6-12yrs) who were out of school.
<b>Chronic Illness</b>	List of illnesses considered chronic: Heart disease – Cancer – HIV/AIDS – Lupus – Kidney Disease – Sickle Cell Anaemia – Lung Disease – Epilepsy – Neurological disorder – Clinical Mental Disease
<b>Educational Attainment</b>	Educational attainment refers to the highest level of education reached by an individual, but not necessarily completed by the individual.
<b>Female labour force participation rates (indicator)</b>	An indicator for the Empowerment dimension of the Gender Inequality Index which provides the percentage of the female working age population (ages 15-64) that actively engages in the labour market, by either working or actively looking for work.
<b>Female population with at least secondary education (% ages 25 yrs and older) (indicator)</b>	An Empowerment dimension indicator which describes the percentage of the female population aged 25 and older; which has at least secondary school education.
<b>Female shares of parliamentary seats (indicator)</b>	An indicator for the Empowerment Dimension of the Gender Inequality Index which gives the percentage of seats held by the female gender in the lower or upper house or senate.
<b>Gender Inequality Index</b>	The Gender Inequality Index reflects gender-based disadvantage in three dimensions: reproductive health, empowerment and the labour market. This index shows the loss in potential human development due to inequality between female and male achievements in these dimensions. It ranges from 0, which indicates that women and men fare equally, to 1, which indicates that women fare as poorly as possible in all measured dimensions.
<b>Household Budget Survey</b>	Commonly referred to as the HBS - this is a national survey which focuses on households' expenditure on goods and services and which is primarily used for revision of the Index of Retail Prices.
<b>Household Income per capita (indicator)</b>	The sole indicator for the decent standard of living dimension in the National Human Development Index. This indicator is the yearly mean income earned by all members of all households. It is calculated using the total income of all members of all households divided by the number of household members.
<b>Human Development Dimensions</b>	The various scopes of interest which act as the foundations for the Human Development Indices.
<b>Human Development Indicators</b>	These are indicators which are used to construct the different Human Development Indices.
<b>Inequality Adjusted Human Development Index</b>	The Inequality-adjusted National Human Development Index adjusts the National Human Development Index for inequality in distribution of each dimension across the population.
<b>Iodized Salt (indicator)</b>	One of two sub-indicators which make up the primary indicator of Nutrition in the Multidimensional Poverty Index. It describes households' usage of iodized salt. A household is considered deprived in Nutrition if the household is not using adequately iodized salt.

<b>Male labour force participation rates (indicator)</b>	An indicator for the Empowerment dimension of the Gender Inequality Index which provides the percentage of the male working age population (ages 15-64) that actively engages in the labour market, by either working or actively looking for work.
<b>Male population with at least secondary education (% ages 25 yrs and older) (indicator)</b>	An Empowerment dimension indicator which describes the percentage of the male population aged 25 and older; which has at least secondary school education.
<b>Male shares of parliamentary seats (indicator)</b>	An indicator for the Empowerment Dimension of the Gender Inequality Index which gives the percentage of seats held by the male gender in the lower or upper house or senate.
<b>Maternal Mortality Ratio (indicator)</b>	This is an indicator used for the construction of the Gender Inequality Index. It states the number of maternal deaths, expressed per 100,000 live births. Maternal death is defined as the death of a woman while pregnant or within 42 days after terminating a pregnancy, regardless of the length and site of the pregnancy, due to any cause related to or aggravated by the pregnancy itself or its care but not due to accidental or incidental causes.
<b>MDGs</b>	The Millennium Development Goals (MDGs) are eight international development goals that all 193 United Nations member states and at least 23 international organizations have agreed to achieve by the year 2015.
<b>Multidimensional Poverty Index</b>	The Multi-dimensional Poverty Index identifies multiple deprivations at the individual level in education, health and standard of living. The MPI value is the product of two measures: the multi-dimensional headcount ratio and the intensity (or breadth) of poverty.
<b>Multiple Indicator Cluster Survey</b>	The Multiple Indicator Cluster Survey (MICS) is a household survey programme developed by UNICEF to assist countries to fill gaps in data for monitoring the situation of children and women.
<b>National Human Development Index</b>	National Human Development Index (NHDI) is a summary measure of human development. It measures the average achievements in three basic dimensions of human development: health, knowledge and a decent standard of living.
<b>Population with Chronic Illness (indicator)</b>	An indicator for the Health dimension in the National Human Development Index - which gives the percentage of the population suffering from at least one chronic illness (refer to chronic illness for a listing of illnesses).
<b>Primary and secondary educational attainment rate (indicator)</b>	One of two knowledge dimension indicators for the National Human Development Index. This indicator gives the percentage of children between ages 6-16 who have attained a primary or secondary school level of education
<b>Purchasing Power Parity</b>	Purchasing power parities (PPPs) are the rates of currency conversion that equalise the purchasing power of different currencies by eliminating the differences in price levels between countries.
<b>Secondary and Higher Educational Attainment Rate (indicator)</b>	One of two knowledge dimension indicators for the National Human Development Index. This indicator provides the percentage of the population; aged 16 and over, who have attained at least a secondary school level of education.
<b>Citizen Security Survey</b>	A questionnaire or interview given to a sample of the population to determine whether people have been victims of crime.
<b>Years of schooling (indicator)</b>	An Education indicator for the Multidimensional Poverty Index which describes the number of years of schooling members of a household have achieved.
